Contents

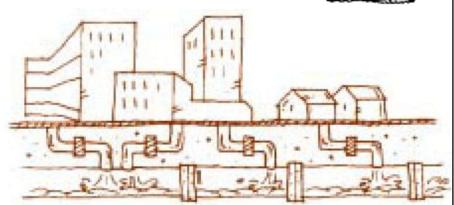

Drainage below ground

Testing & sewage pumping

Methods of sewage disposal

Sewage treatment process

- Sewage (= domestic/municipal wastewater)
 - Pollute the environment & harm human health
 - Should be 'treated' before discharged
- Sewage 污水 (wastewater) consists of:
 - Greywater (from sinks, bathtubs, showers, dishwashers, and clothes washers)
 - Blackwater (from toilets, combined with the human waste that it flushes away)
 - Soaps, detergents & toilet paper
- Rain/storm water/surface runoff

(See also: Sewage - Wikipedia https://en.wikipedia.org/wiki/Sewage)

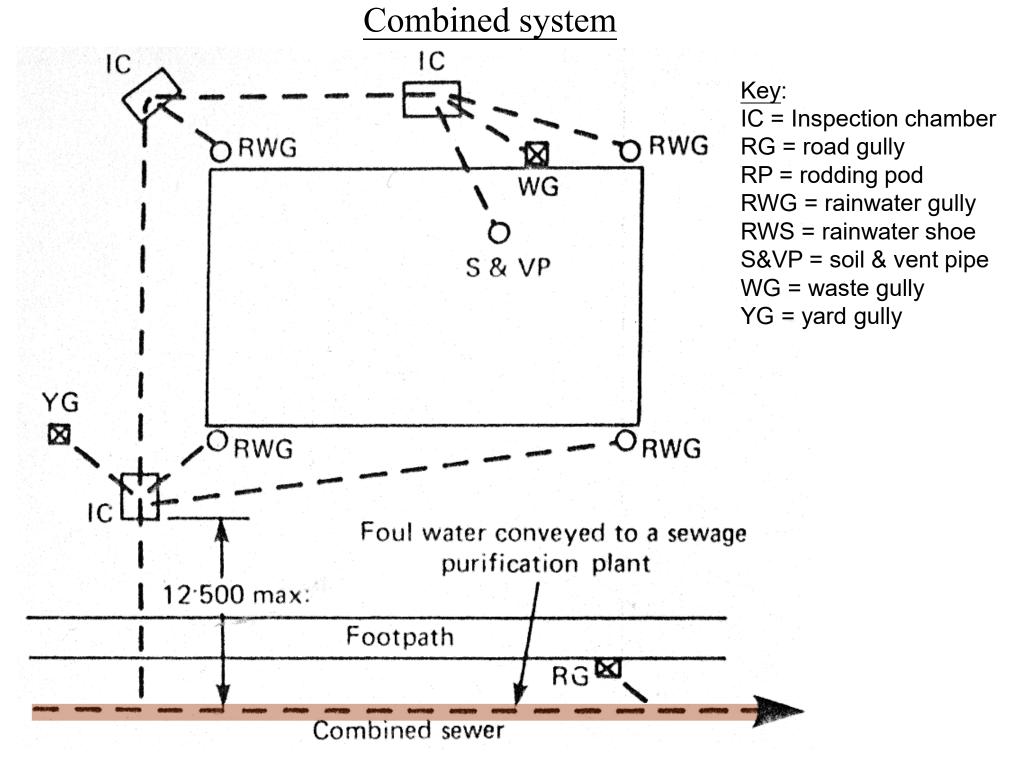

- Sewage infrastructure & systems
 - Collection: by a system of sewer pipes
 - Treatment: remove the contaminants to produce liquid and solid (sludge) suitable for discharge to the environment or for reuse
 - At central sewage treatment plants or on-site systems
 - <u>Disposal</u>: to rivers, streams or the sea
 - Reuse of treated or untreated sewage: e.g. reclaimed water, converted to biogas or fertilizer

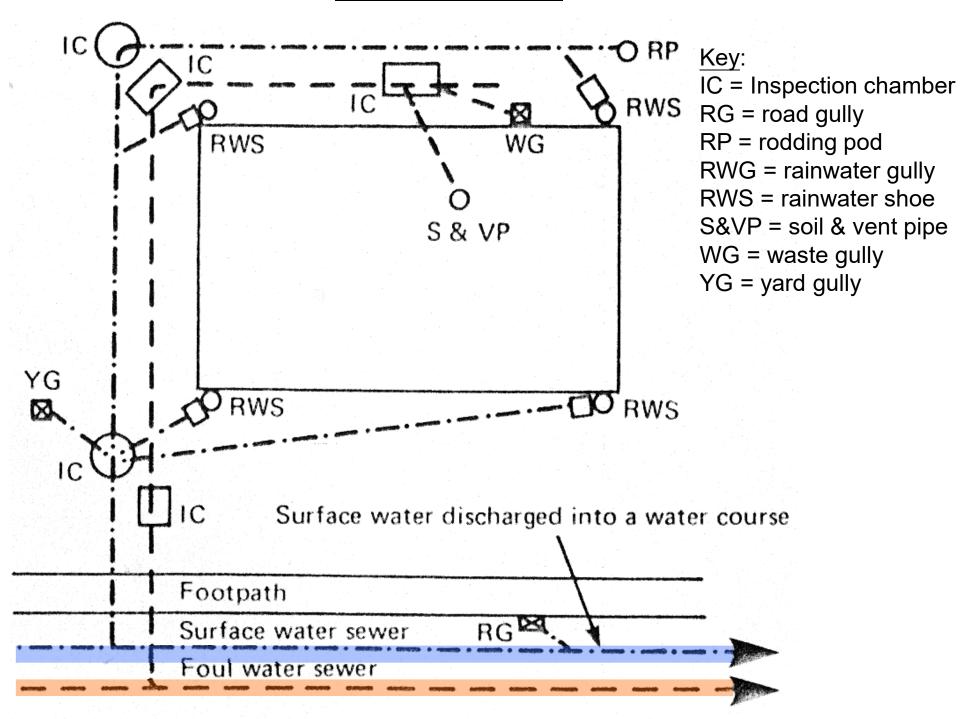

- Basic design objectives
 - Operate without or minimal input of energy
 - Reliable and require little maintenance
 - Drains are not subject to undue stress
 - Fully accessible for occasional clearance
- Design calculations: based on flow rates, discharge units, gradients, pipe material & pipe diameter
 - Hydraulic calculation may be required

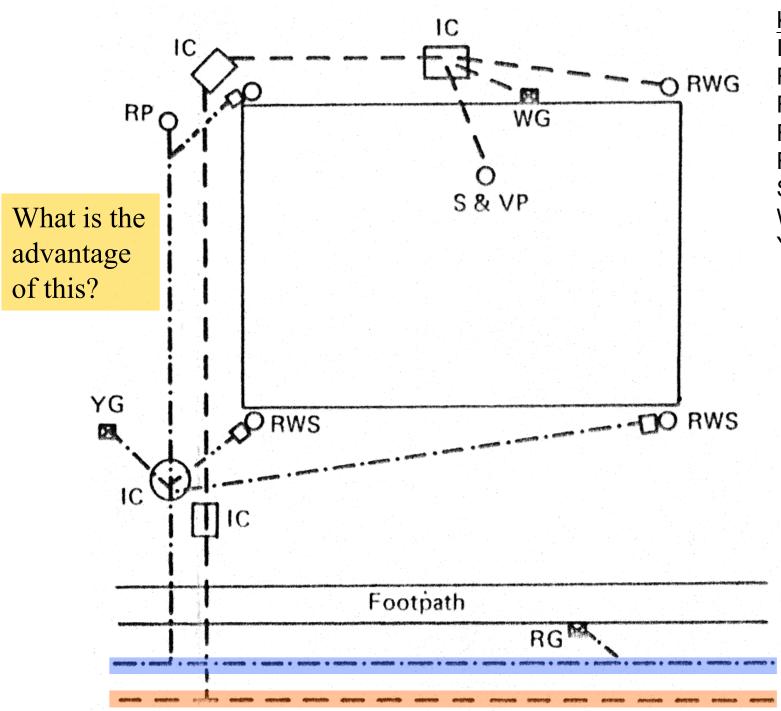

- System types
 - 1. Combined system (foul water + rainwater)
 - 2. Separate system
 - 3. Partially separate system
- Design considerations: costs, load on sewers
- Common fittings
 - Rainwater gully (RWG), yard gully (YG)
 - Inspection chamber (IC), rodding pod (RP)
 - Shoe and rest band (smooth connection)

Separate system

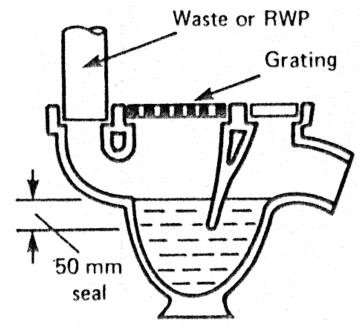

Partially separate system

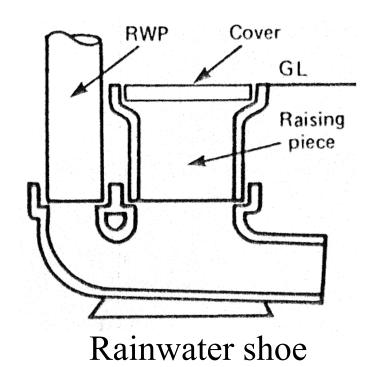

Key:

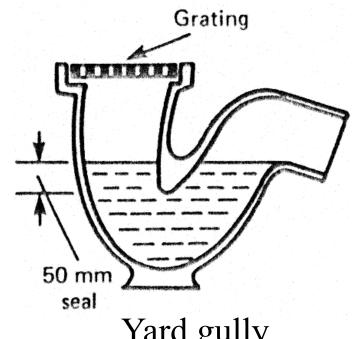

IC = Inspection chamber
RG = road gully
RP = rodding pod
RWG = rainwater gully
RWS = rainwater shoe
S&VP = soil & vent pipe
WG = waste gully
YG = yard gully

- Most of the surface water conveyed by a surface water drain to a surface water sewer or soakaway
- Some rainwater is discharged to the foul water drain. The rainwater can be conveniently connected to the foul water drain, usually at the rear of the building

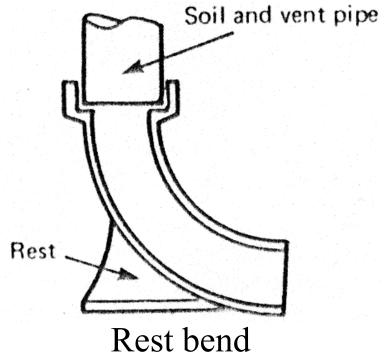

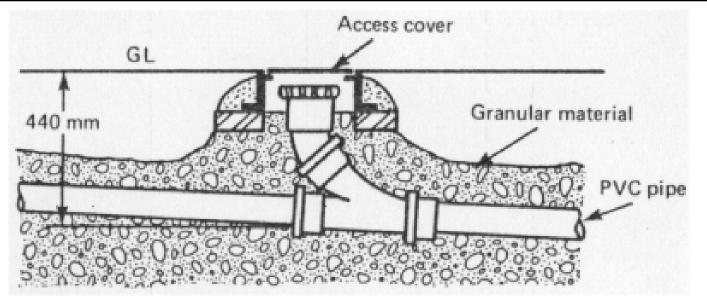

Waste or rainwater gully

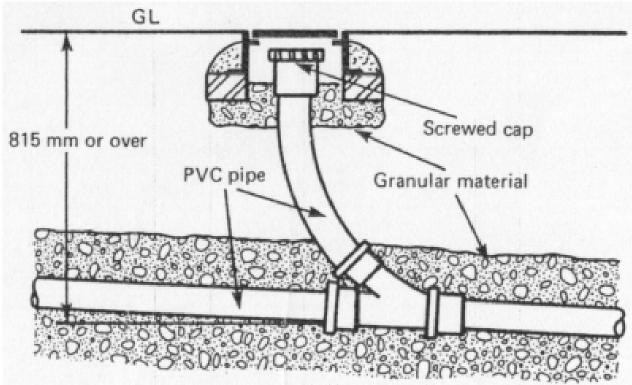

Yard gully

Shallow rodding point

Deep rodding point

Combined drainage system

• Pros:

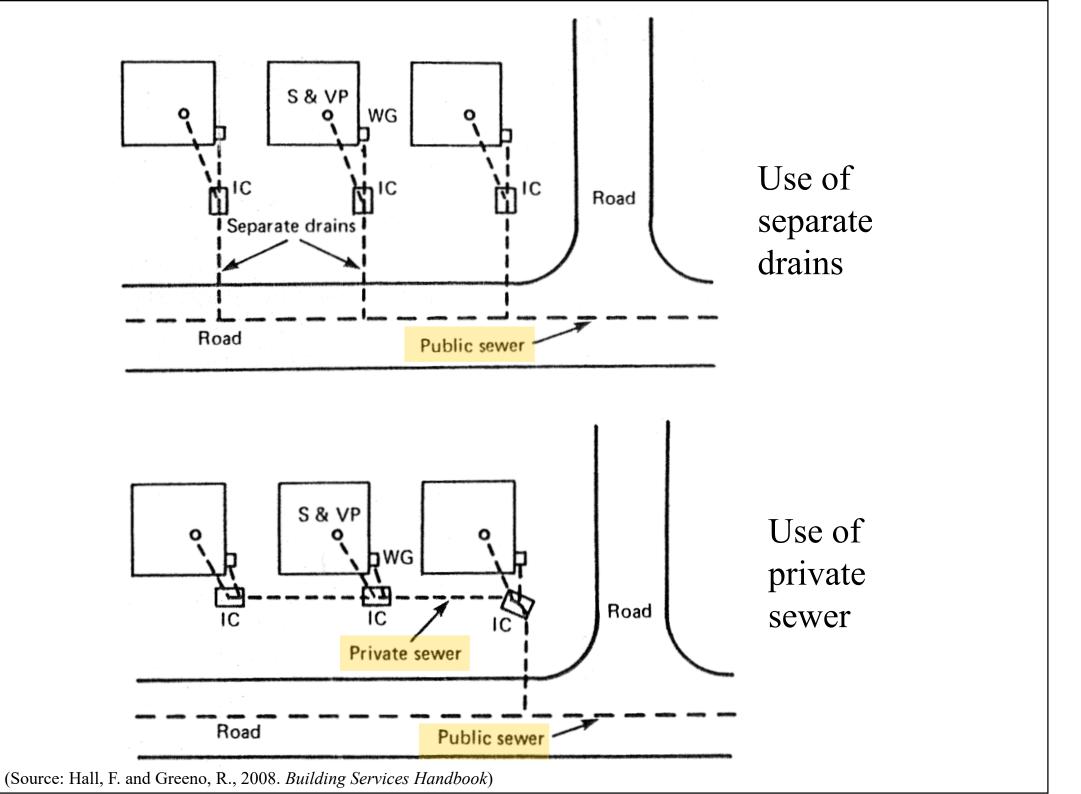

- One drain for both foul & surface water reduces cost of drainage
- No risk of making a wrong connection
- Foul water flushed through the drain by the surface water

Cons:

- The loss of a trap seal in a rainwater gully allows the foul gas from the drain to pass into the open air around the building
- The size of the sewage disposal plant is greater
- Greater cost of the sewage disposal
- Possibly greater pumping costs (surface water and foul water to reach sewage disposal works)

- Separate drainage system
 - Pros:
 - Sewage disposal plant is much smaller
 - The cost of sewage purification is less
 - Less sewage is pumped → reduction in pumping cost
 - Surface water flow can be by gravity to a nearby river
 - Cons:
 - Two sets of drains increase the cost of building drainage
 - Risk of a wrong connection (a foul water branch drain to a surface water drain)
 - The foul water drain not thoroughly flushed by rainwater
 - Foul air passing through an unsealed rainwater gully trap

- Connection of drainage to sewer
 - Must be made obliquely in the direction of flow
 - Drain to another drain
 - Drain to a private sewer (私家污水渠)
 - Drain to a public sewer (公共污水渠)
 - Cost and maintenance issues
 - Private sewer/drain up to & include terminal manhole: paid by building owner
 - Public sewer & sewer linking the terminal manhole: paid by government/authority

- Stormwater or foul sewers?
 - Swimming pool main drain, footbath main drain and swimming pool make-up tank drain → stormwater drains
 - The filtration plant backwash → foul sewers
 - Drainage serving open transport interchanges and cargo handling areas → to stormwater drains (via petrol interceptor)
 - But allow stormwater bypass during peak flow periods

- Pipe materials and depth
 - A minimum diameter of 150 mm and be of the following materials or other approved materials:-
 - Foul sewer vitrified clay, ductile iron, uPVC
 - Storm water drain concrete, ductile iron, uPVC
 - Larger sewer: concrete
 - Smaller drains: clayware/uPVC
 - Drains should be laid at a depth of 900mm (minimum) under roads and at least 600mm below fields and gardens

- Underground drainage pipe
 - Foul sewers should be designed so that the velocity of the flow will exceed the self-cleansing velocity on a regular basis
 - As a general guide, the minimum fall of foul sewers is:
 - Pipe diameter 100 mm:- Fall 1:40
 - Pipe diameter 150 mm:- Fall 1:70
 - Pipe diameter 225 mm:- Fall 1:100
 - Pipe diameter 300 mm:- Fall 1:150

- Manholes (沙井)
 - They are required when
 - Pipes merge together
 - Change in direction >45 degree
 - Change in gradient

Sewage (small squares)

Stormwater (round & radical patterns)

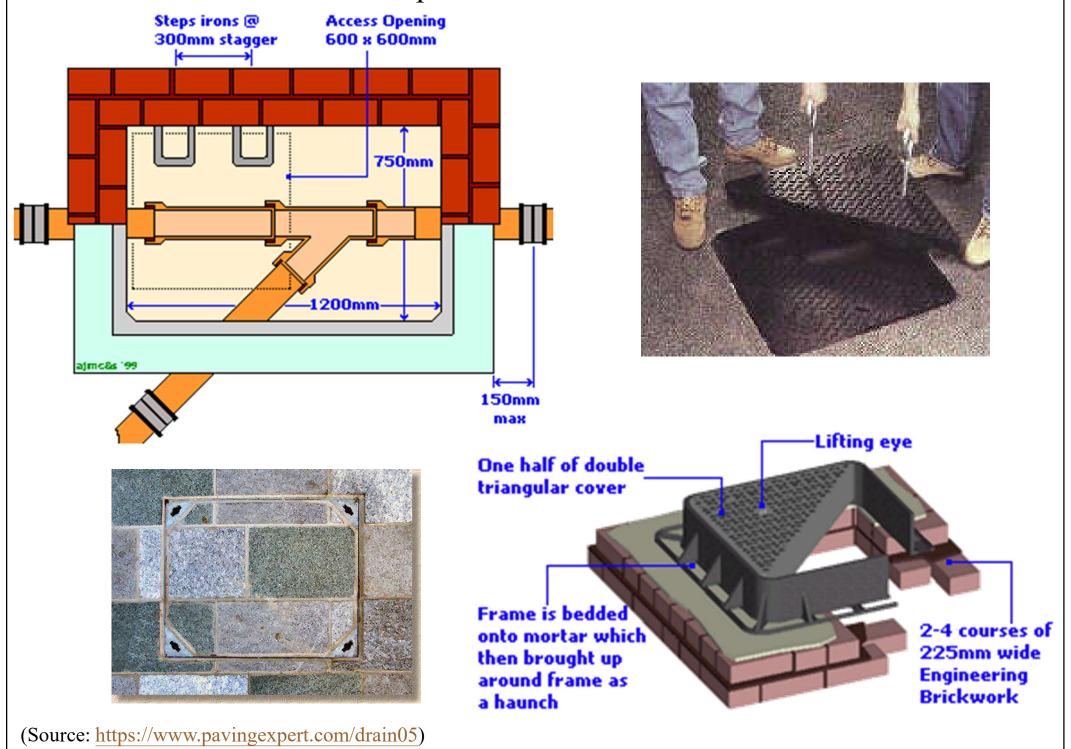

Maintenance, cleaning, inspection are needed

Underground
Drain Pipe

Manhole
(For pipe merging)

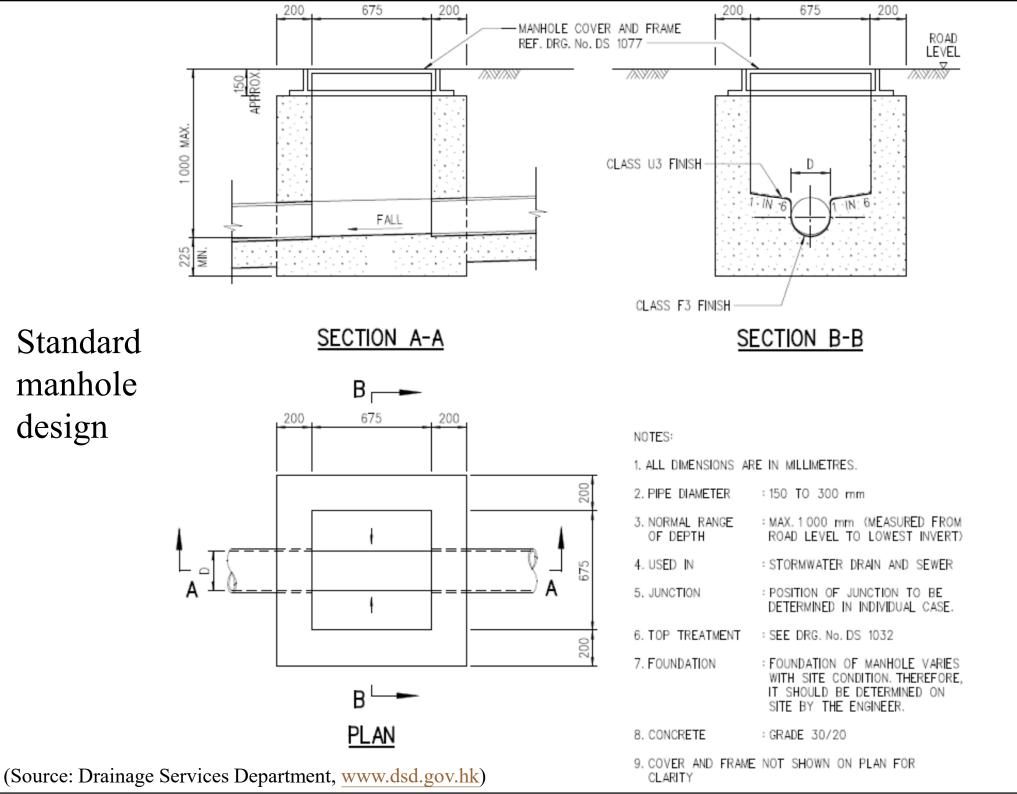

Manhole
(For maintenance)

Manhole in plan view and manhole covers

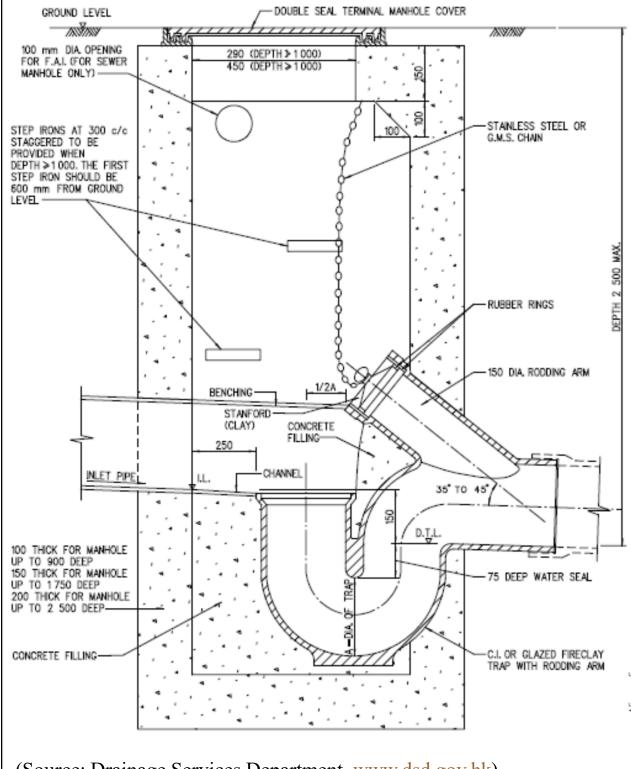

- Manholes (沙井) (cont'd)
 - Construction
 - 215 mm thick brickwork in cement mortar or 125 mm thick 1:2:4 reinforced concrete or other approved
 - Inside surface cement rendered
 - Cast iron cover (double-sealed airtight cover if inside or under a building)
 - See the standard drawings by DSD
 - Every building or project should have only one "terminal or last manhole" to public sewer

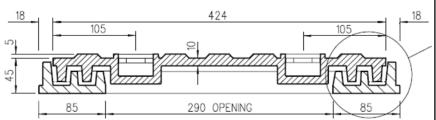

design

Terminal manhole, typical characteristics:

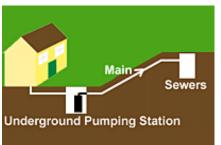

- Trapped
- Rodding arm for cleaning
- Opening for fresh air intake (FAI)
- Steps for maintenance

Double-sealed manhole cover

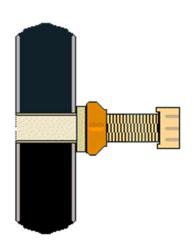

(Source: Drainage Services Department, www.dsd.gov.hk)

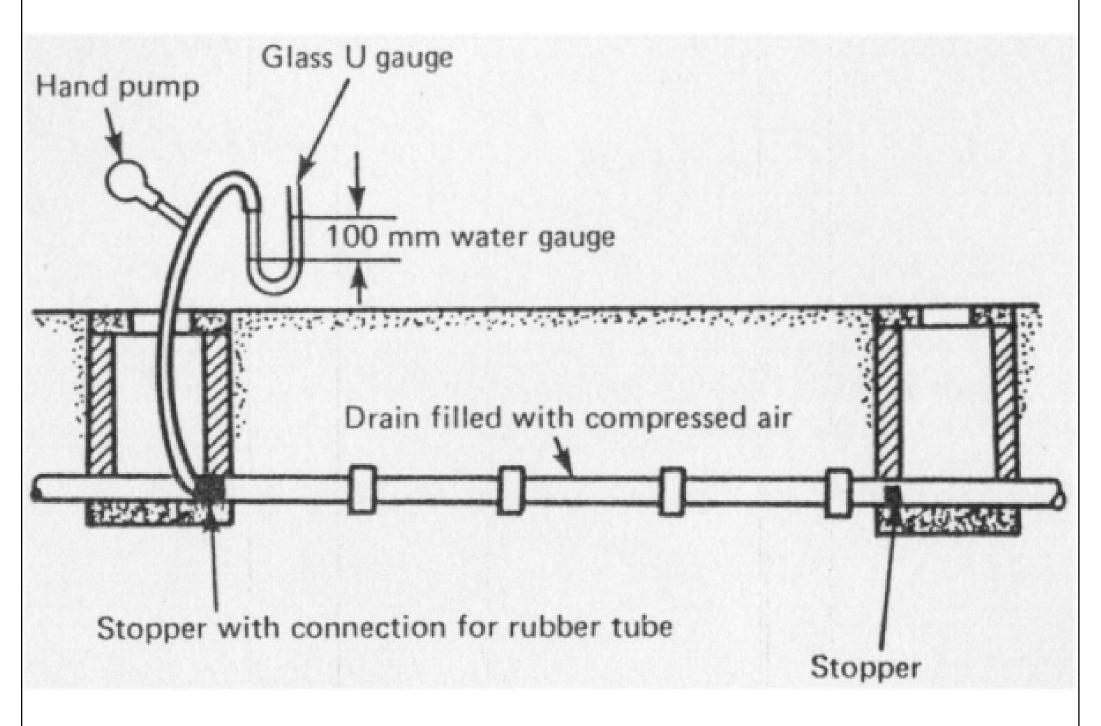

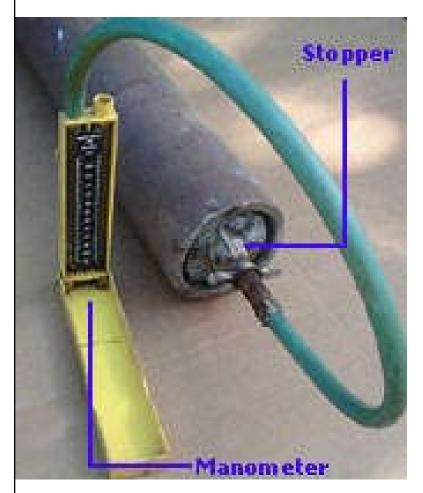

- Acceptance tests of drainage systems
 - 1. Air test
 - With hand pump and stoppers
 - 2. Smoke test
 - With smoke machine and stoppers
 - 3. Water test (most common for u/g drains)
 - Seal ends of drains & connections with approved plugs
 - Fill with water to produce 1.5m head at high end
 - Allow for initial absorption
 - Measure loss of water over 30 minutes

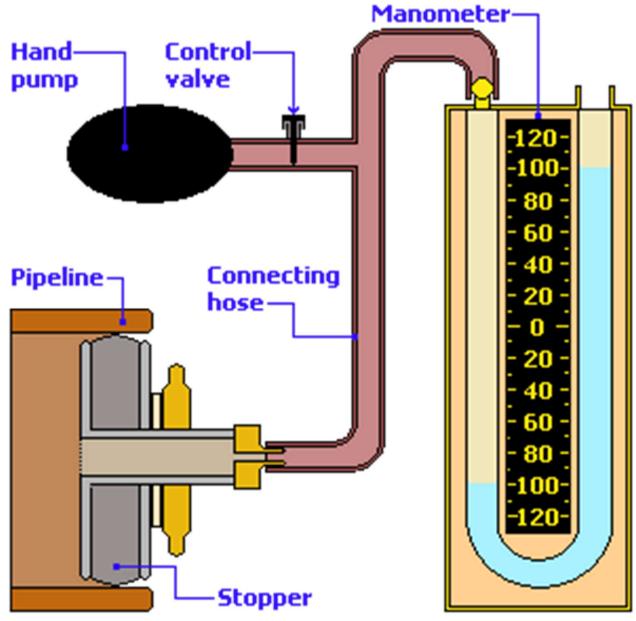

Air test on drains

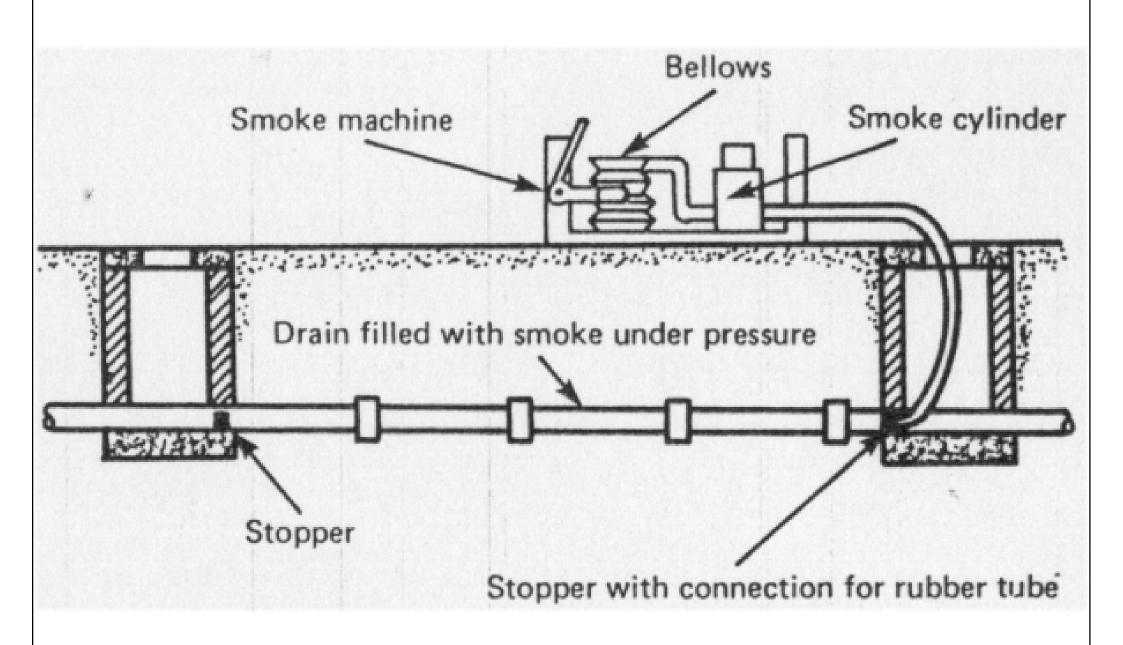

Set up of air testing on drains

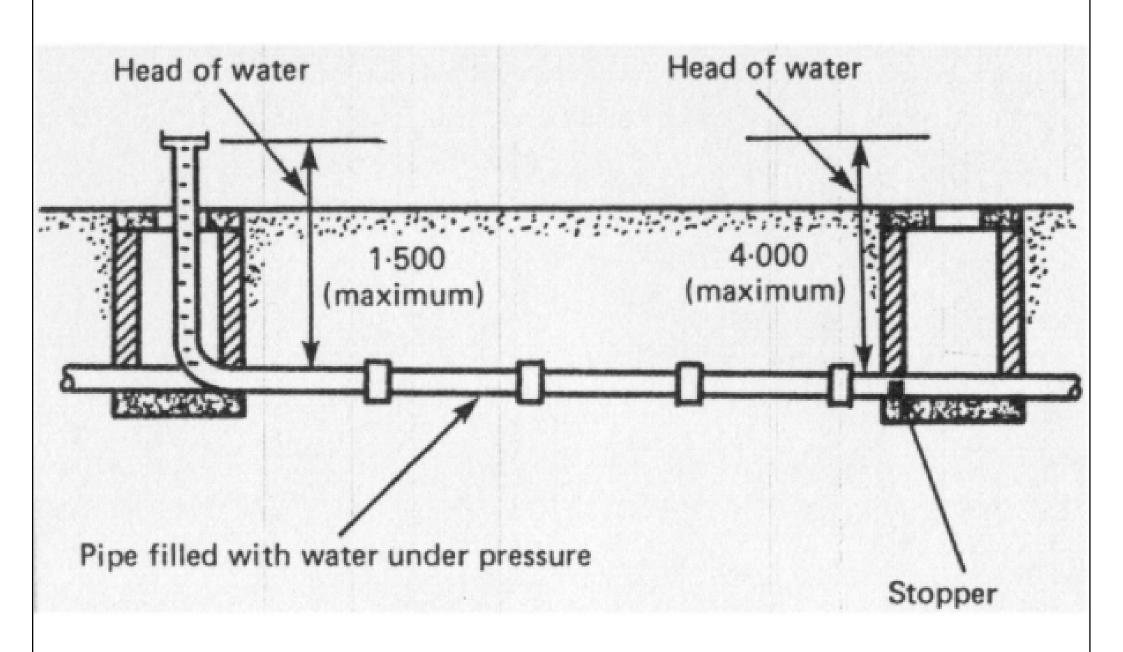

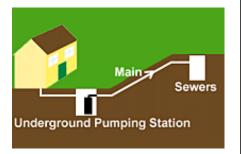

(Source: https://www.pavingexpert.com/drain11)

Smoke test on drains

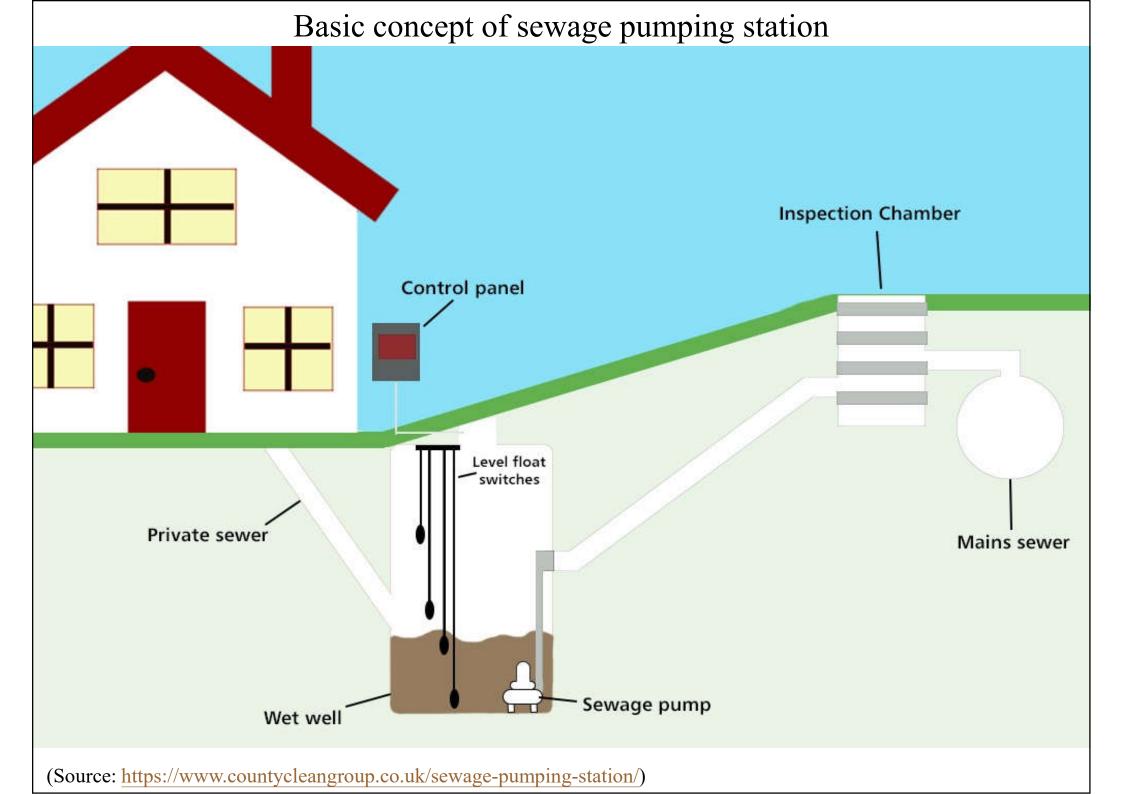

Water test on drains

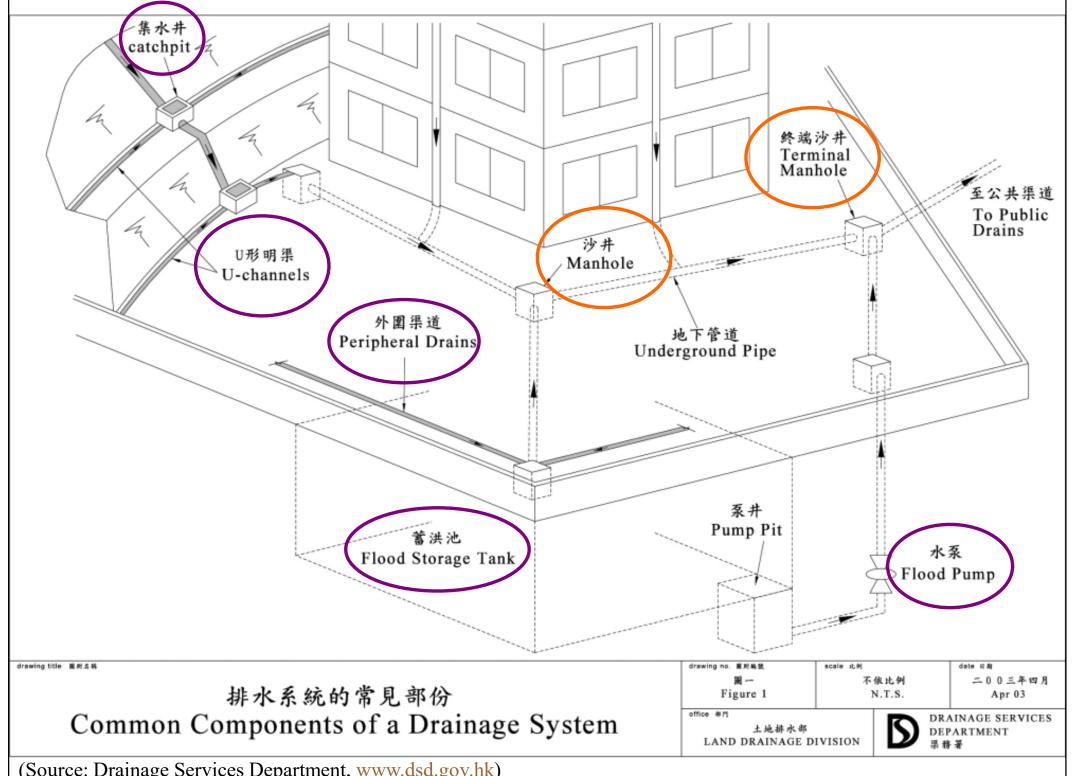

Testing & sewage pumping

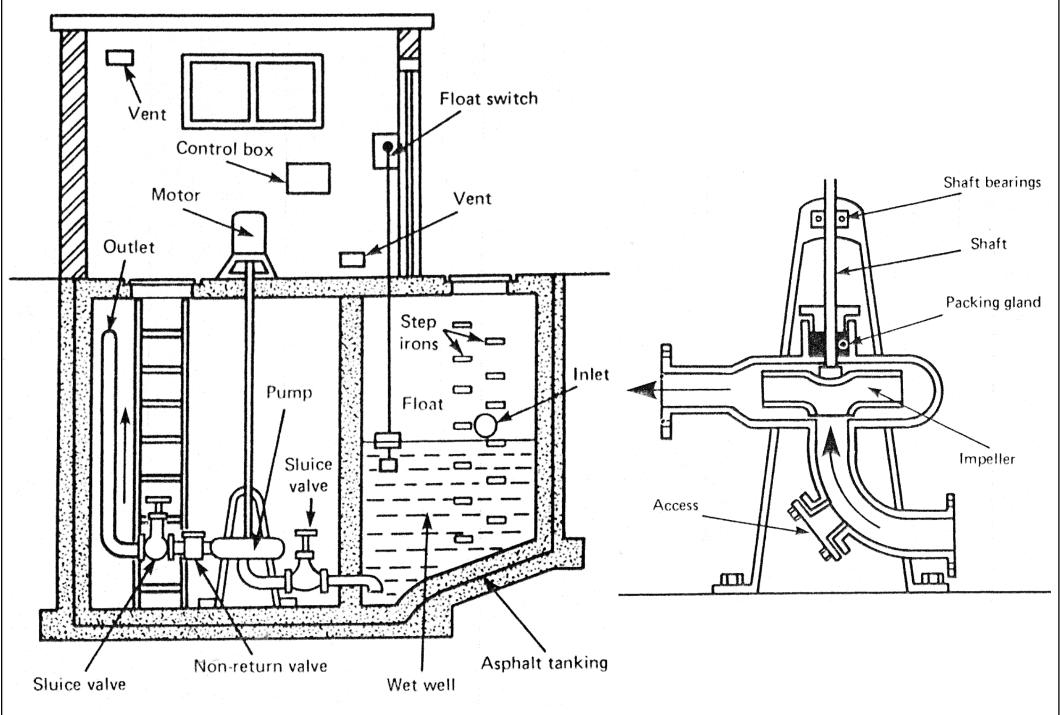

- Whenever possible, gravity flow should be used for drainage & sewage
- If site levels do not permit, sewage pumping stations can be used, such as those with centrifugal pumps
 - Installed below the fluid (self-priming)
 - Impeller curved on plan to reduce risk of blockage
 - Discharge pipe pass into a manhole before connected to public sewer

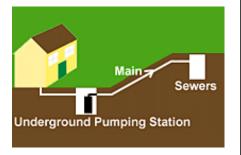

(Source: Drainage Services Department, www.dsd.gov.hk)

Sewage pumping station using a centrifugal pump

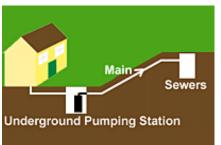

Testing & sewage pumping

- Sewage ejector may replace centrifugal pump in the sewage pumping station
 - Less risk of blockage
 - Fewer moving parts and less maintenance
 - A wet well is not required
 - One compressor unit can supply compressed air to several ejectors

Sewage pumping station using an ejector Compressed air cylinder Guard rail Compressor and motor Cast-iron rocking weight Exhaust pipe GL Valve gear -Compressed Top collar air pipe Outlet Rod C В Inlet Inlet manhole Float Non-return valve Non-return valve Bottom collar Asphalt tanking Ejector

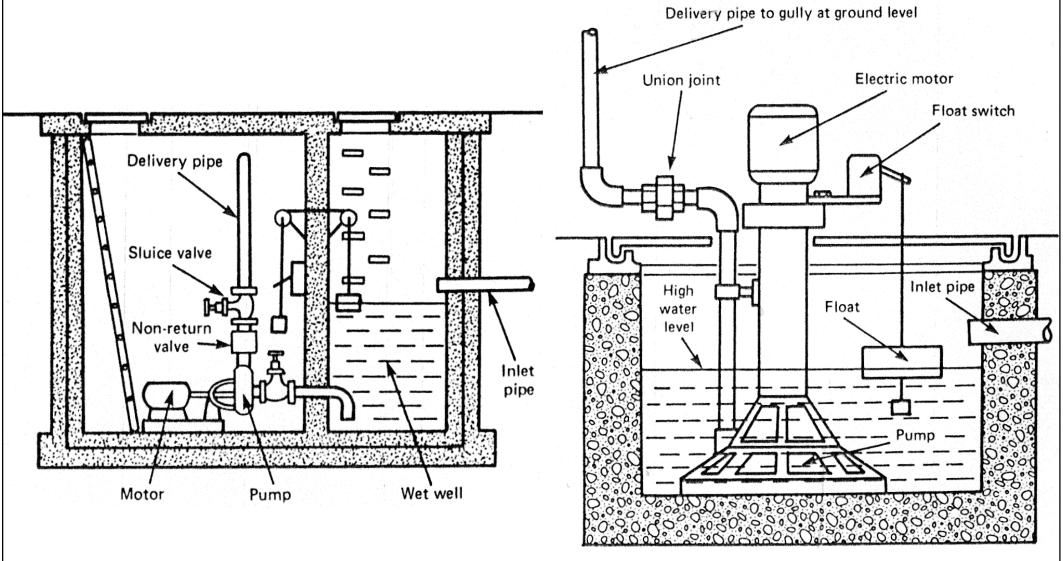

- Design considerations
 - Information required
 - Type of the drainage flow
 - Maximum quantity of flow per hour
 - Height to which the fluid has to be lifted
 - Length of delivery pipe
 - Type of electric supply (a.c. or d.c.)
 - Motor room below ground level
 - Much neater and the noise can be isolated
 - Sump pump needed to remove water seepage/leakage

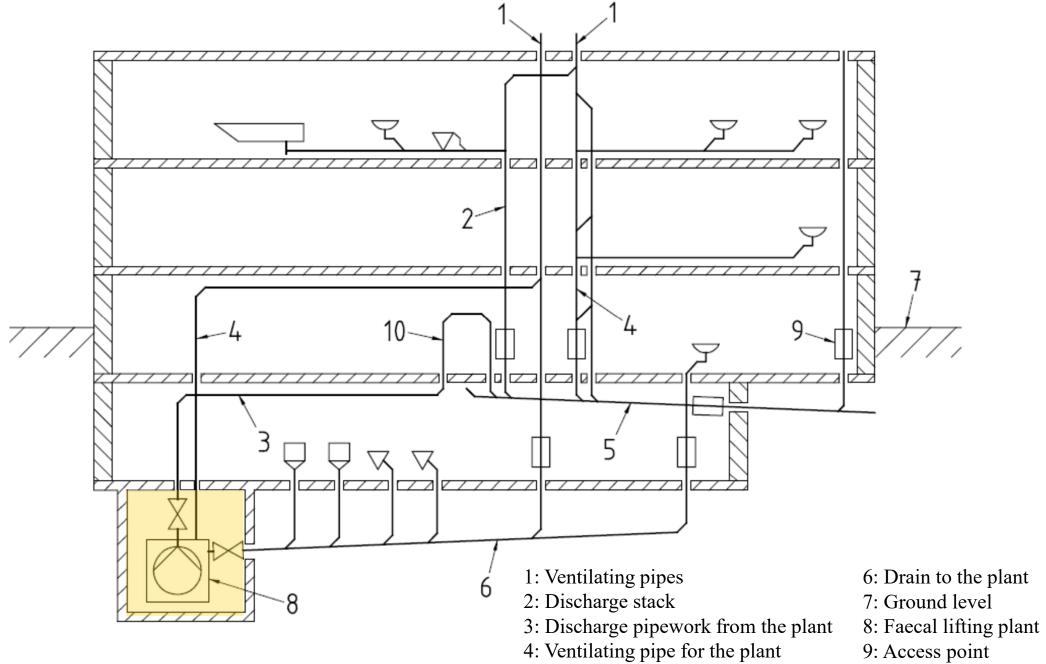

Underground pump room and sump pump

Underground pump room

Sump pump

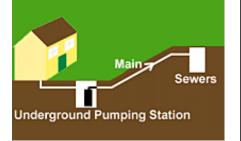

Illustration of a faecal lifting plant to a drain

10: Backflow loop

(Source: Bristish Standard BS EN12056-4:2000)

Testing & sewage pumping

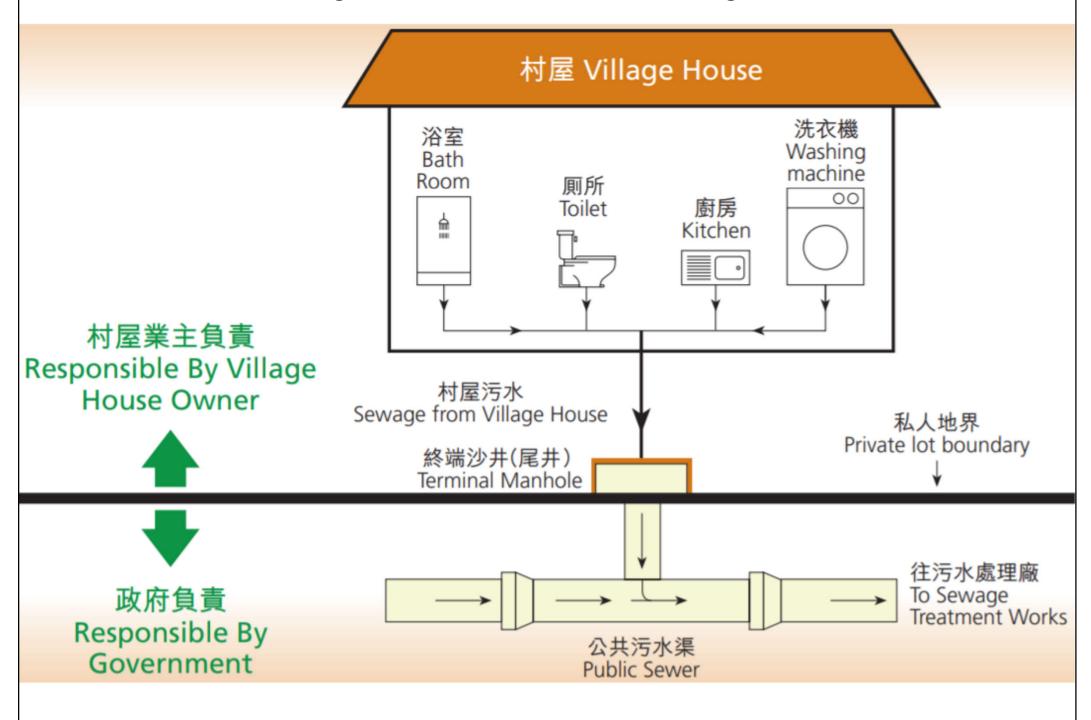

- Classification of sewage pumping stations
 - (a) Wet well/dry well pumping stations
 - (b) Submersible pumping stations
 - (c) Screw pumping stations (or Archimedean screw pumping station)
- Design considerations
 - Land/space requirements, structural design
 - Electrical system supply
 - Odour & noise control

- Controlling water pollution from sewage in Hong Kong
 - Connections to Sewers Under the Water Pollution Control Ordinance
 - https://www.epd.gov.hk/epd/english/environmentinhk/water/guide_ref/guide_wpc_csuw.html
 - Connect to public sewers leading to government treatment plants (Drainage Services Department)
 - In rural areas not served by public sewers, private developers need to provide their own sewage treatment facilities

Arrangement for connection of village sewer

(Source: Drainage Services Department http://www.dsd.gov.hk/)

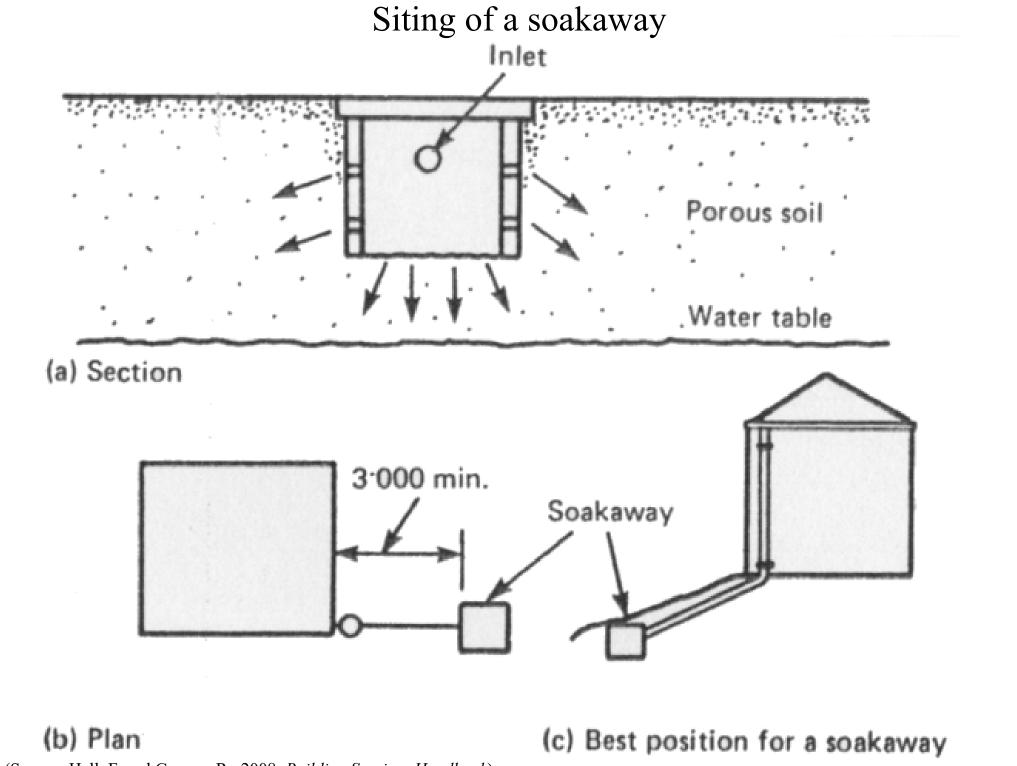

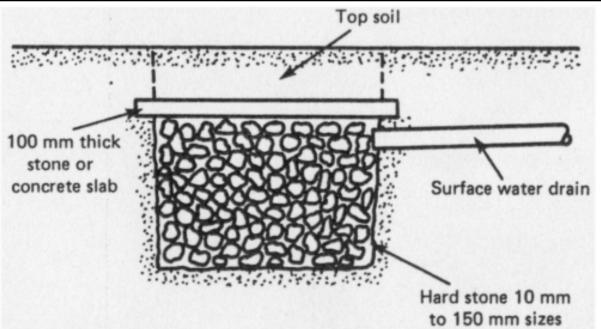

- Guidelines from the Environmental Protection Department (EPD) https://www.epd.gov.hk/
 - Guidance Notes on Discharges from Village Houses
 - https://www.epd.gov.hk/epd/english/environmentinhk/water/guide ref/guide_wpc_dv.html
 - Guidelines for the Design of Small Sewage Treatment Plants (up to 2,000 population)
 - https://www.epd.gov.hk/epd/english/environmentinhk/water/guide ref/guide_wpc_stp.html
 - Guidelines for Estimating Sewage Flows for Sewage Infrastructure Planning (Version 1.0)
 - https://www.epd.gov.hk/epd/english/environmentinhk/water/guide_ ref/gesf.html

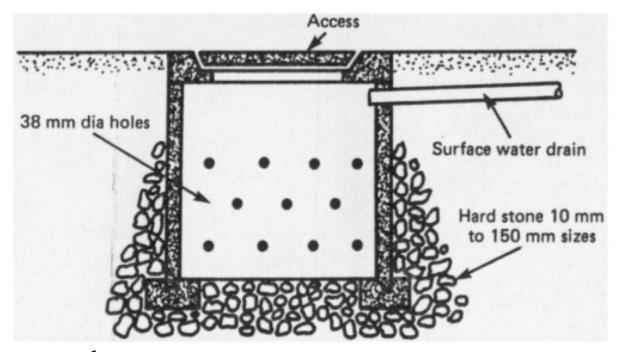

- Disposal of stormwater or rainwater
 - <u>Sewer</u>: combined or a separate surface-water
 - Interceptors required for car parks and kitchens
 - Soakaway: ground permeability
 - Using perforated precast concrete, dry stone or brick pit
 - Storage (see Drainage Services Dept.'s example)
 - Artificial pond or lake, or underground storage tank
 - Watercourse
 - Expected flow rates at normal and flood levels

Filled soakaway

Precast concrete soakaway

- Public sewers
 - If they are within 30 m of the site boundary, connection should be made
 - If they are further away, additional pipework will be required (the authority may bear the cost)
 - In Hong Kong, either the Government bears this cost or a local sewage treatment is required
- Three disposal methods if no public sewers:
 - Dilution
 - Conservancy
 - Treatment

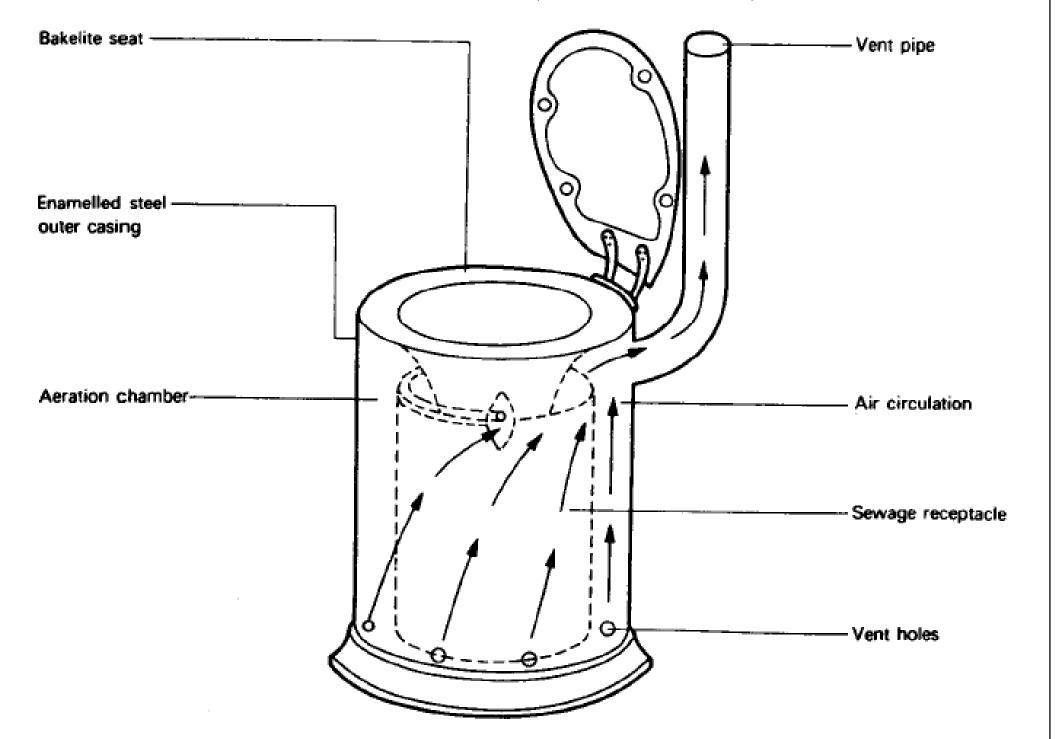

- Basic design parameters
 - Flow rate, (litre/head/day)
 - Load: Biochemical oxygen demand (BOD) (mg O₂/litre) and total suspended solids (SS) (mg/litre)
- Dilution
 - With large amount of water
 - Oxidation of the organic matter by the oxygen dissolved in the water
 - Not appropriate for large demand
 - Civil work can be very expensive

- Conservancy
 - Retained on the site & periodically removed
 - In temporary buildings, use chemical closets
 - Portable types, used in camping sites and aircraft
 - As fixed types incorporating an underground storage tank in schools, factories and dwellings in rural areas
 - The sterilising fluid breaks down the solids of sewage
 - Smells control a deodorising agent with the chemical, or by an oil film which seals off the surface

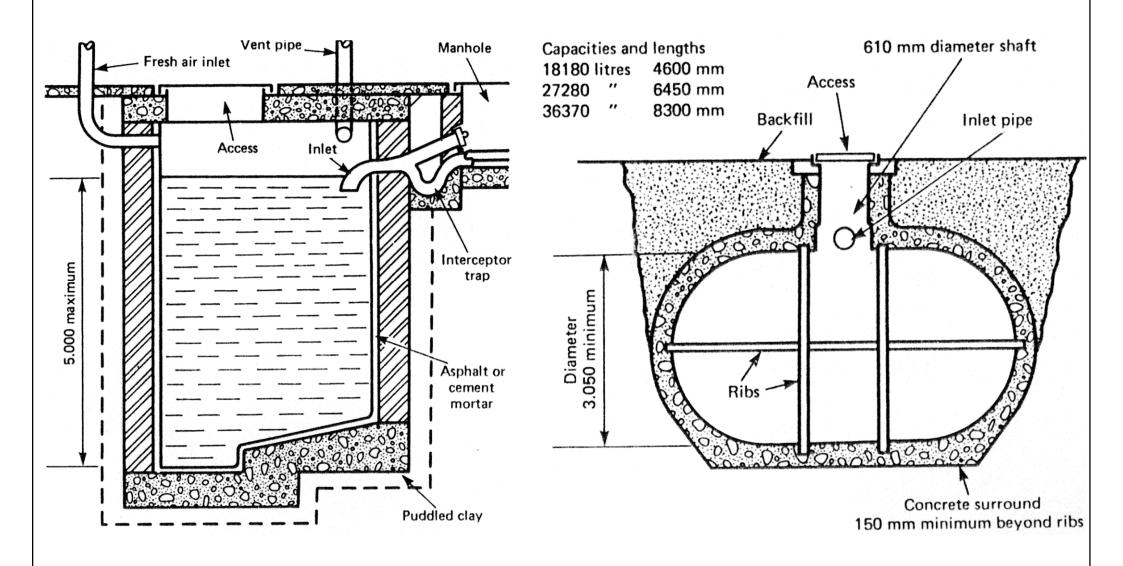

Chemical closets (化學處理廁所)

- Conservancy (cont'd)
 - In other buildings, use cesspools (污水池) to receive & store the flow from drains
 - For temporary buildings or permanent buildings not served by sewers
 - Be watertight & ventilated (usually underground)
 - Pump-out from cesspools at intervals
 - Access road for cleaning & emptying is required
 - Cesspool capacity: (based on UK practice)
 - Often based on a 45-day flow; about 18-45 m³
 - For dwelling, 0.11-0.14 m³ per day per person

Two types of cesspools (污水池)

Brick cesspool

Glass reinforced polyester cesspool

- Conservancy using cesspools in HK
 - Statutory requirements
 - Location: Not situated within 20 m of any spring, stream of water or well, the water source for drinking or domestic purposes and for preparation of food/ drink for human consumption, etc
 - <u>Disposal of contents</u>: With adequate means for removal of its content without carrying through any building in which any person resides or works

- Conservancy using cesspools in HK (cont'd)
 - Statutory requirements: <u>Capacity</u>
 - Minimum capacity determined by Building Authority
 - Capable of storing the quantity of soil and waste discharged during a period of a month
 - Soil and waste discharged is designed at 135 litres per day per person who uses soil/waste fitments
 - Building Authority to determine the number of persons using soil or waste fitment

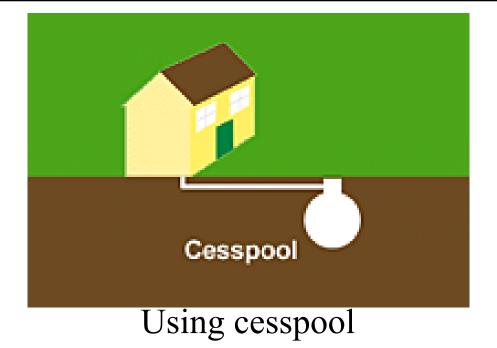

- Conservancy using cesspools in HK (cont'd)
 - Statutory requirements: Construction
 - Construct of brickwork in cement mortar/concrete/other approved material
 - Impervious (inside or outside)
 - Reinforced concrete cover
 - With access for cleaning
 - Adequately ventilated
 - Internal faces rendered with cement mortar

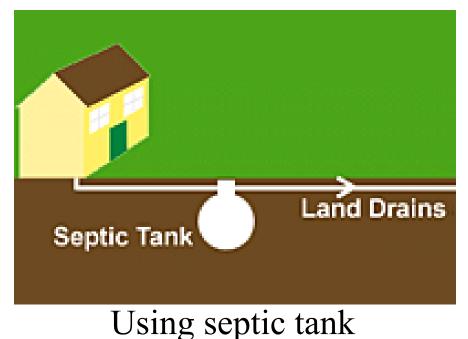

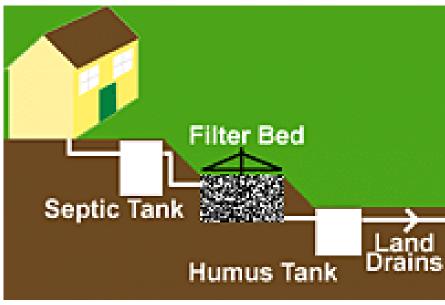

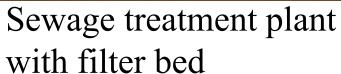

Treatment

- Sewage treatment plant to make the effluent sufficiently innocuous (harmless) before discharge to stream/soil
- Process (1) settling (2) oxidization (3) discharge
- Alternatives
 - a) Septic tank + Soakaway
 - b) Septic tank + Biological filter + Humus tank
 - c) Package sewage treatment plant
 - d) (Large scale) sewage treatment plant

Package sewage treatment unit

(Source: www.johnstonsmith.co.uk/fact2.html)

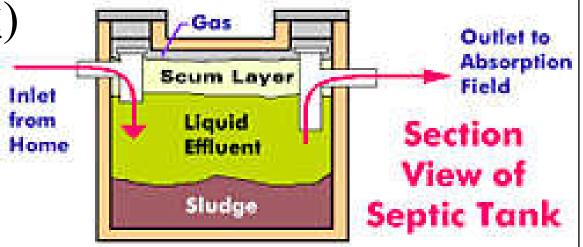

- Treatment (cont'd)
 - Choice:
 - Small sewage treatment plant or
 - Septic tank + soakaway
 - Use septic tank + soakaway for
 - Small development with a population of less than 50
 - Site percolation test find it viable and no adverse conditions exist

• Septic tank (化糞池)

- Effect on sewage
 - 'Scum' on the top
 - 'Liquor' in middle
 - 'Sludge' at bottom

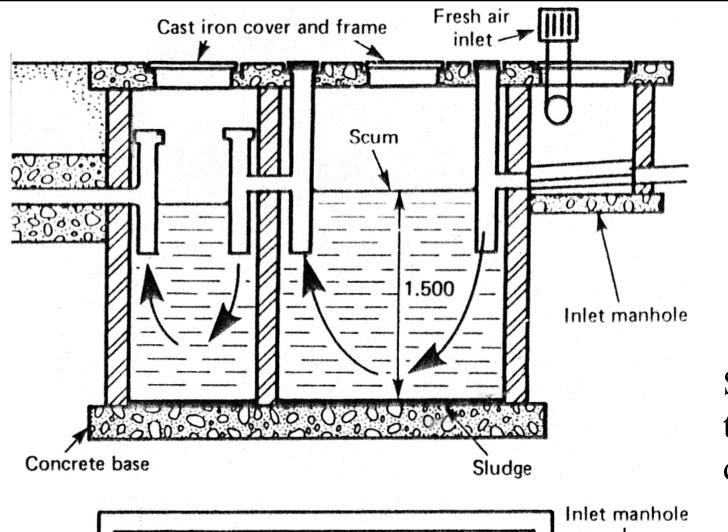

- Break down organic content by <u>anaerobic</u> bacteria (no oxygen); reduce sludge quantity & odours
 - The process can take 2 months or more
 - In large plant, sludge gas can be used for power/heating

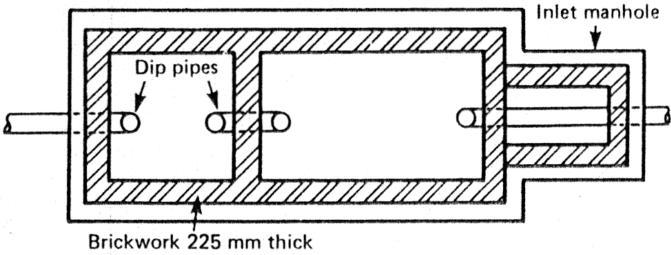

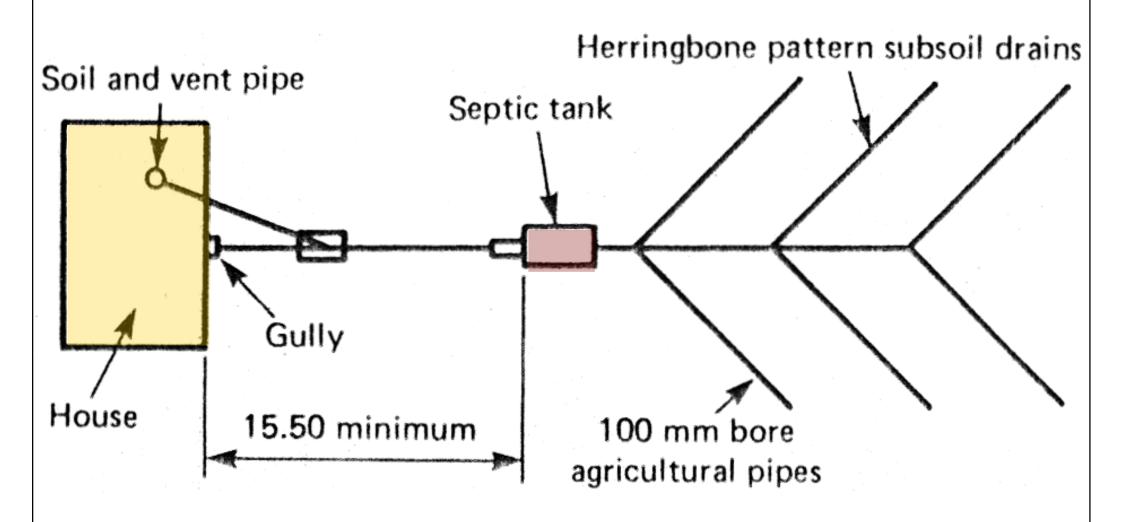

- Septic tank (cont'd)
 - Capacity: 16-48 hours flow; min. 3.5 m³
 - Suitable dimensions
 - Content not disturbed by any entering flows
 - Contain the accumulation of sludge
 - Volume of sludge = 0.8 litres per person per day
 - Materials: concrete is most common
 - Single or multiple chambers can be used

Septic tank design

Site plan of septic tank installation

- Septic tank statutory requirements in HK
 - Situation of septic tank
 - At a minimum of 18m away from stream of water or well, water source for drinking, domestic purposes, food preparation or manufacturing factory, etc
 - Disposal of effluent
 - Building owner who is about to install septic tank shall submit to the Building Authority for approval on method of disposal of effluent and sludge
 - Criteria neither nuisance nor injury to health

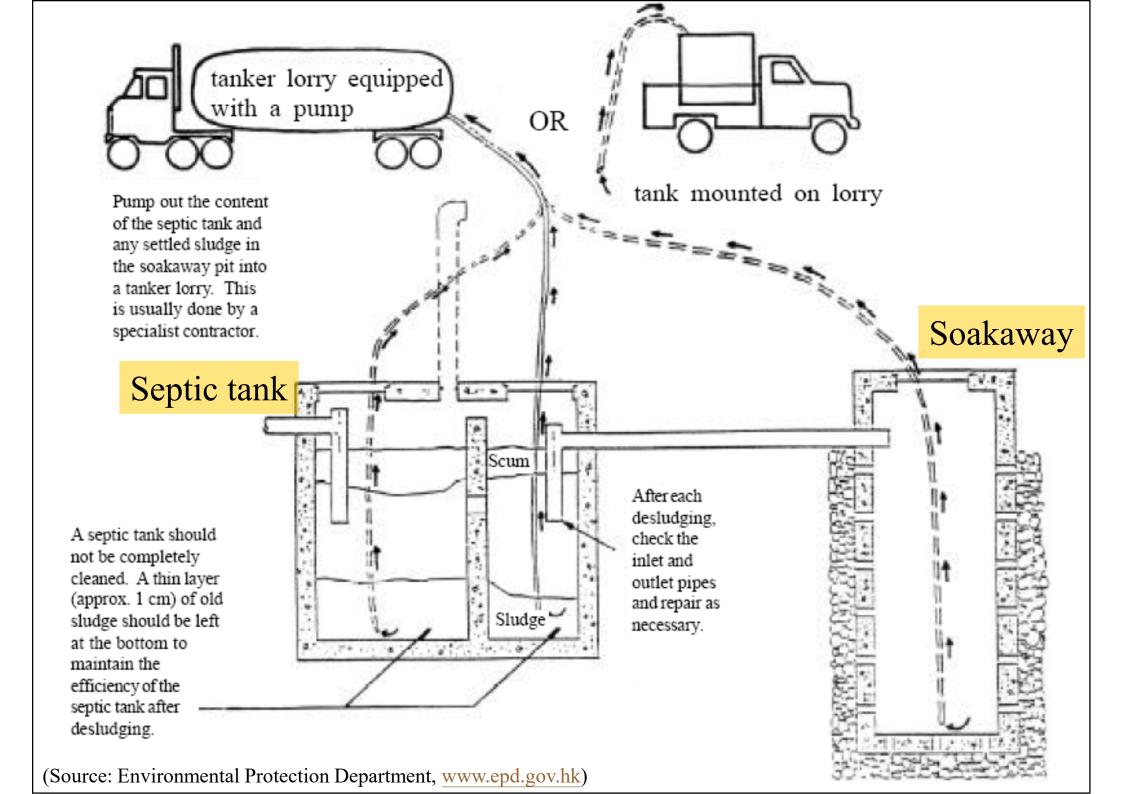

- Septic tank statutory req's in HK (cont'd)
 - Capacity
 - Volume = $2.3 \text{ m}^3 \text{ to } 41 \text{ m}^3$
 - Store soil and waste for one day
 - Calculate soil and waste discharge based on the rate of consumption of potable and flushing water
 - Construction
 - Depth between 1.2m to 1.8m
 - Length = 3 to 4 times of width
 - Adequate means of access for inspection and cleaning

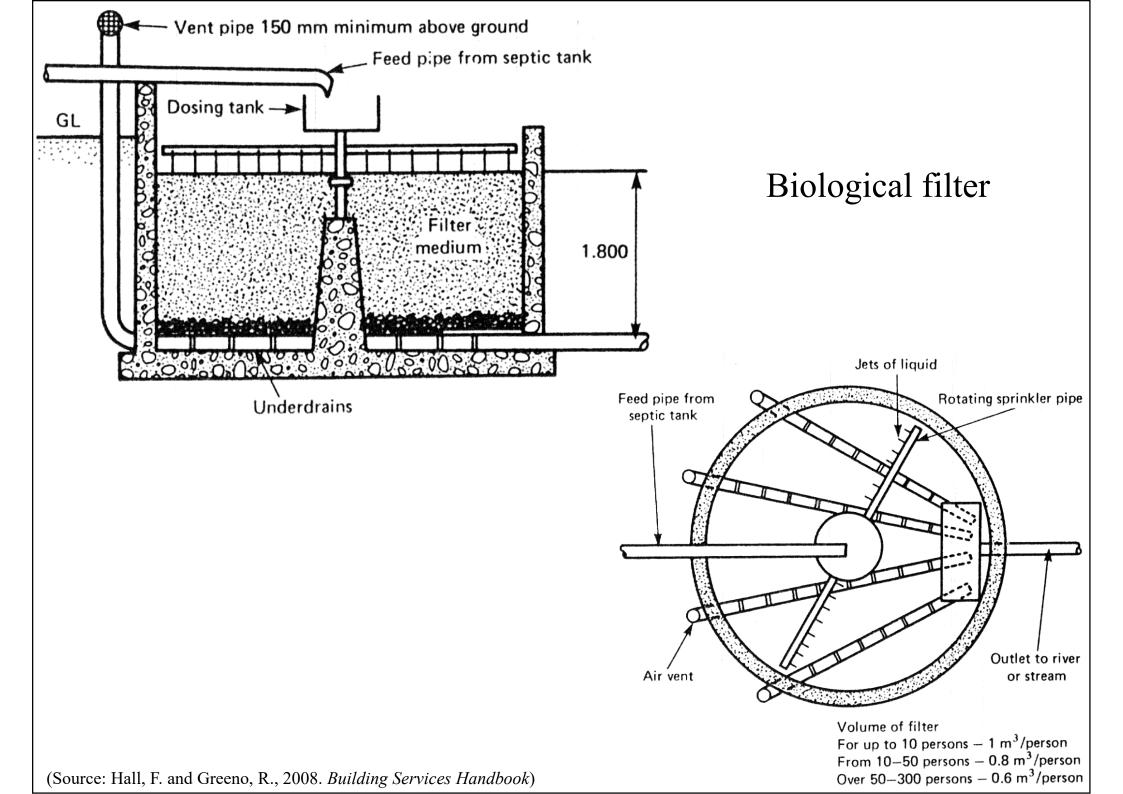

- Septic tank statutory req's in HK (cont'd)
 - Construction
 - Sides of the tank constructed with brickwork in cement mortar min. 215 mm thick or concrete min 125 mm thick, or other approved materials
 - Maintenance
 - Inspect and desludge at least once every 6 months
 - Prevent flooding and overflow
 - Control foul smell

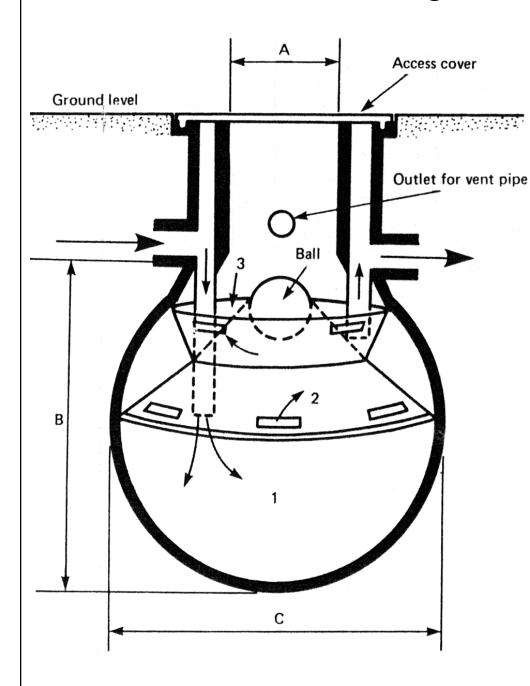

- Biological filter
 - Filled with porous medium, e.g. broken stone, clinker, coke or polythene shingle
 - Surfaces of the medium become coated with an organic film
 - 'Aerobic' bacteria oxidize the polluting matter
 - Ventilation/oxygen is required (such as by under-drains + vertical vent pipes)

- Settlement tank
 - For example, the Klargester settlement tank
 - In glass reinforced plastic
 - Simple, reliable & cost effective for small systems
 - Capacities 2,700-100,000 litres
 - Three separate chambers
 - Sludge must be removed every 12 months

Klargester settlement tank

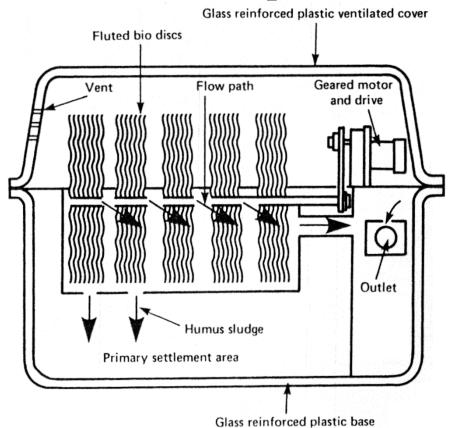

Details of Klargester tank

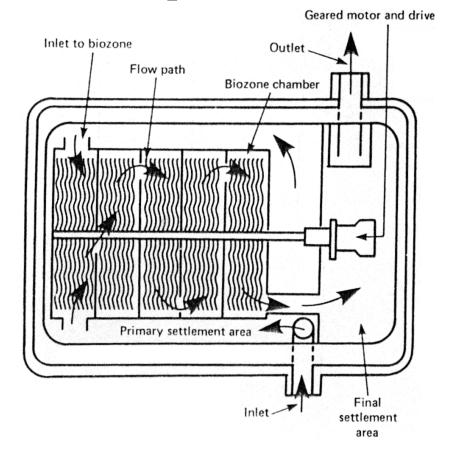

| Capacity of tank in litres | Number of users with flow rate per head per day | | Nominal dimensions in mm. | | |
|-------------------------------------|---|------------|---------------------------|------|------|
| | 180 litres | 250 litres | Α | В | С |
| 2700 | 4 | 3 | 610 | 1850 | 1800 |
| 3750 | 9 | 7 | 610 | 2060 | 2000 |
| 4500 | 14 | 10 | 610 | 2150 | 2100 |
| 6000 | 22 | 16 | 610 | 2400 | 2300 |
| 7500 | 30 | 22 | 610 | 2630 | 2500 |
| 10000 | 44 | 32 | 610 | 2800 | 2740 |

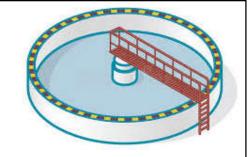

Note: The floating ball will push away to give access into the lowest chamber for sludge removal

- 'Packaged' sewage treatment plant
 - For example, the biodisc treatment plant

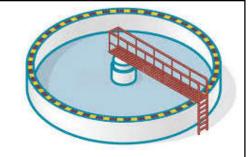

Sewage treatment process

- Sewerage in Hong Kong
 - Everyday, we produce 2.8 million m³ of sewage, enough to fill up over 1,500 Olympic-size swimming pools
 - About 93.7% of the population are now served by the public sewerage system with over 98% of the sewage produced being collected and treated
 - A sewerage network of over 1,900 km in total length and around 324 plants treating sewage prior to disposal to the sea for dilution and dispersion through submarine outfalls

Stage I Tunnels of Strategic Sewage Disposal Scheme (SSDS)

(Source: Drainage Services Department, www.dsd.gov.hk)

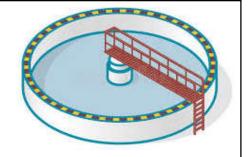

HONG KONG STRATEGIC SEWAGE DISPOSAL SCHEME STAGE I - PRINCIPAL COLLECTION & TREATMENT SYSTEM

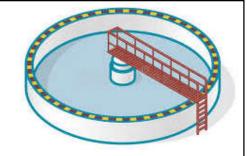

PROFILE OF DEEP TUNNEL SYSTEM

- Sewage charge in HK
 - For 1995-2008, it is \$1.2 per m³ of water supplied
 - For each domestic account, the first 12m³ supplied in each 4 monthly consumption period is exempted
 - From 2008 to 2017, the rate started to increase incrementally, from \$1.31 to \$2.92
- Trade effluent surcharge
 - For industries or commerce where pollution level of the wastewater discharged exceeds that of domestic level

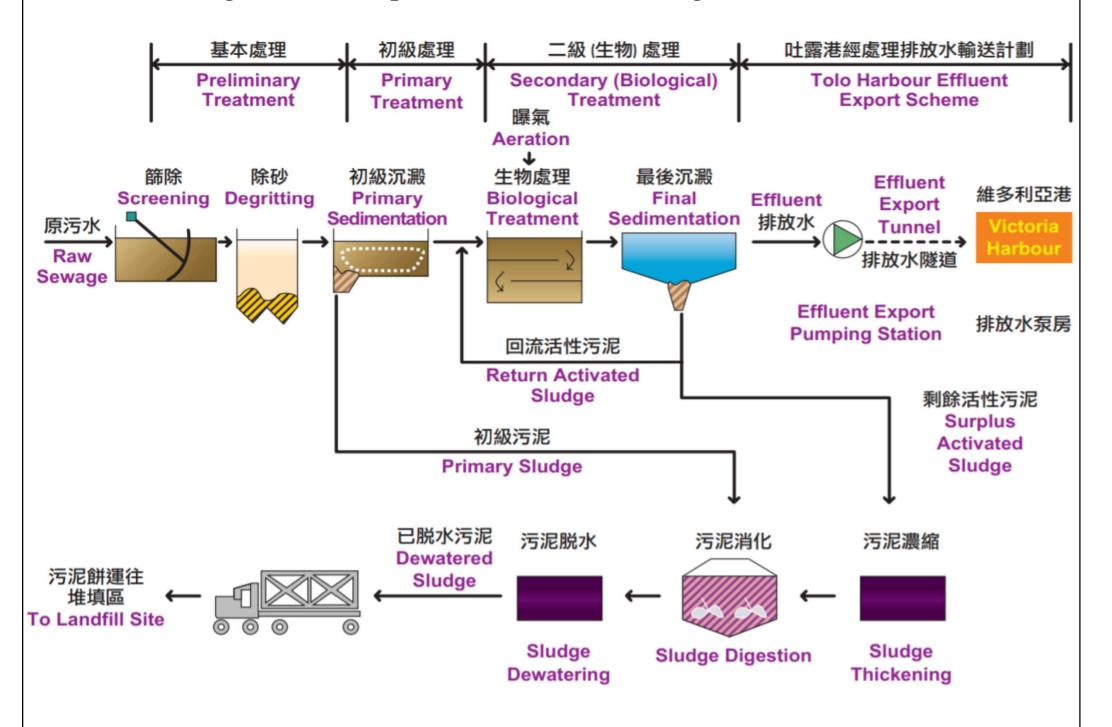

- Sewage treatment
 - Usually done by natural or biological system
 - Can be done by chemical/electrical means (expensive)
 - Typical steps
 - Sedimentation (in septic and settlement tanks)
 - Oxidation of organic matter (using biological agencies)
 - Treated effluent is discharged to watercourse or by surface/subsurface irrigation
 - Sludge (污泥) in tanks is removed, say, every 6 months
 - Either dumped or used as fertilizer

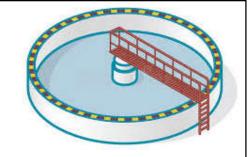

Video: Shatin Sewage Treatment Works (4:09) https://youtu.be/pQ6-LGG-_Bw

Sewage treatment process in Shatin Sewage Treatment Works

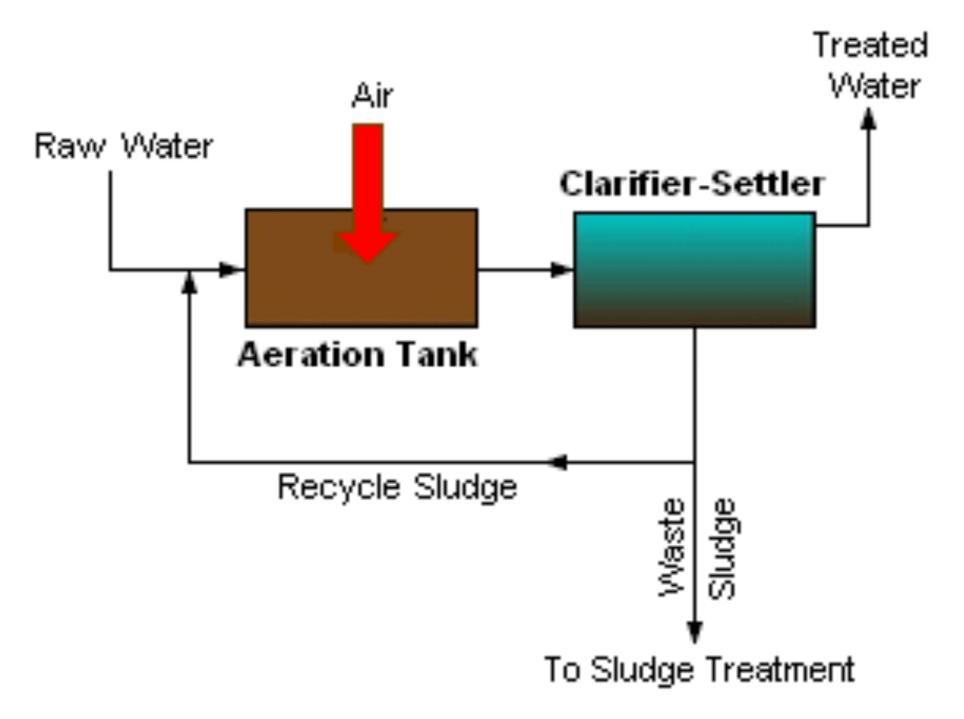

(Source: https://www.dsd.gov.hk/TC/Files/publications publicity/publicity materials/leaflets booklets factsheets/Sha%20Tin%20STW.pdf)

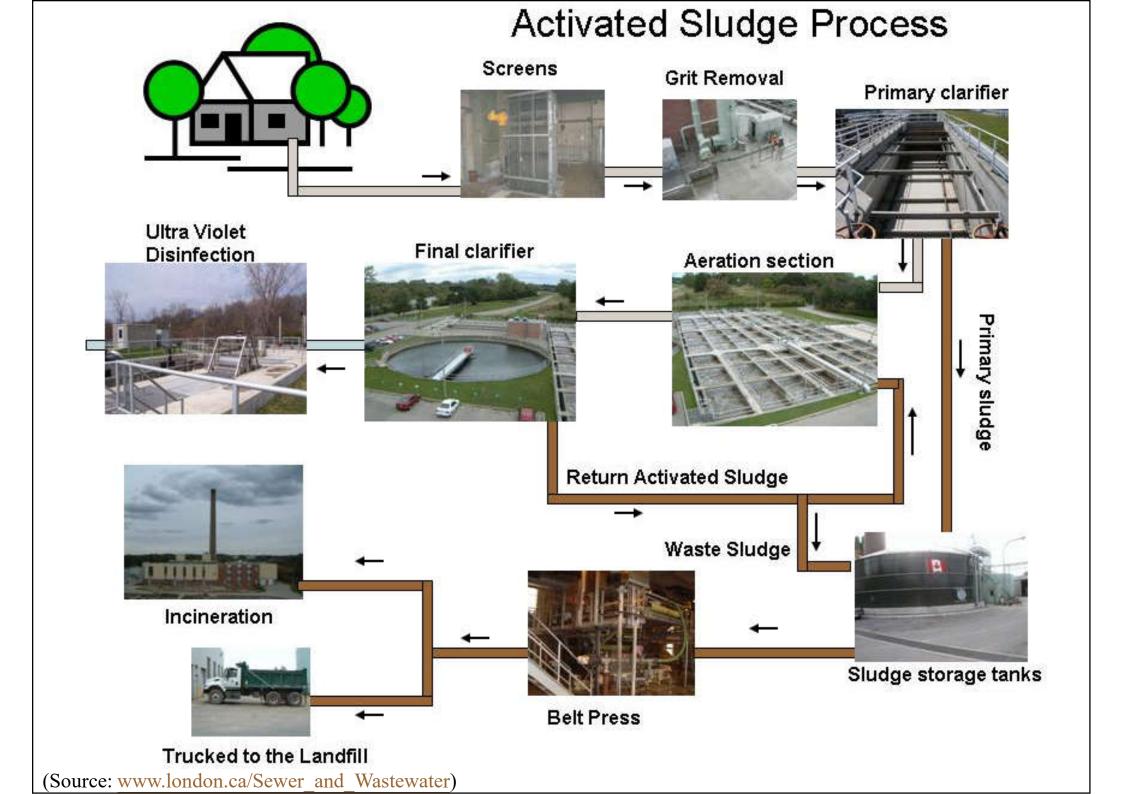

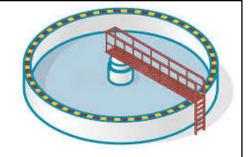

- Sewage treatment (cont'd)
 - Activated sludge process (a biological method):
 - Performed by a variable and mixed community of microorganisms in an aerobic aquatic environment
 - These microorganisms derive energy from carbonaceous organic matter in aerated wastewater (synthesis)
 - A variable number of microorganisms in the system obtain energy by converting ammonia nitrogen to nitrate nitrogen (nitrification)
 - Anaerobic digestion:
 - It involves bacteria that thrive in the absence of oxygen
 - In this sludge process, organics are converted into carbon dioxide and methane gas

A simplified schematic diagram of an activated sludge process

(Source: http://en.wikipedia.org/wiki/Sewage treatment)

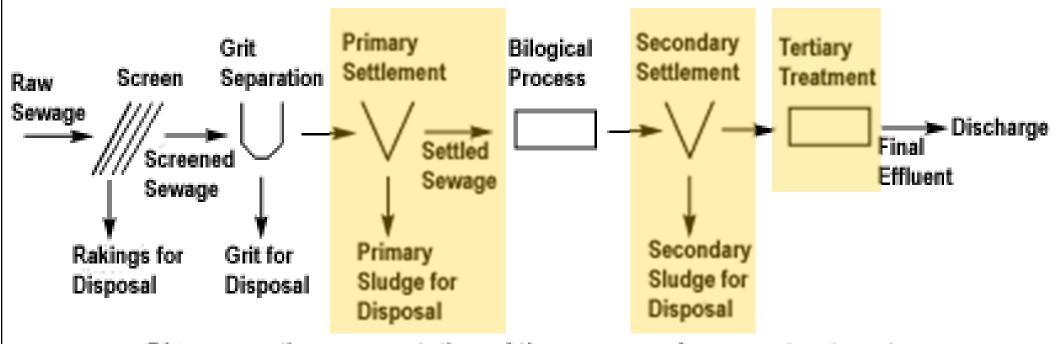

- Main stages of sewage treatment
 - 1. Preliminary works (screens & grit channels)
 - 2. Primary settlement (settlement tanks)
 - 3. Biological treatment (in filter beds, biological contactors or activated sludge)
 - 4. Secondary settlement (humus tanks)
 - 5. Tertiary treatment (needed for high discharge standard or poor raw effluent)

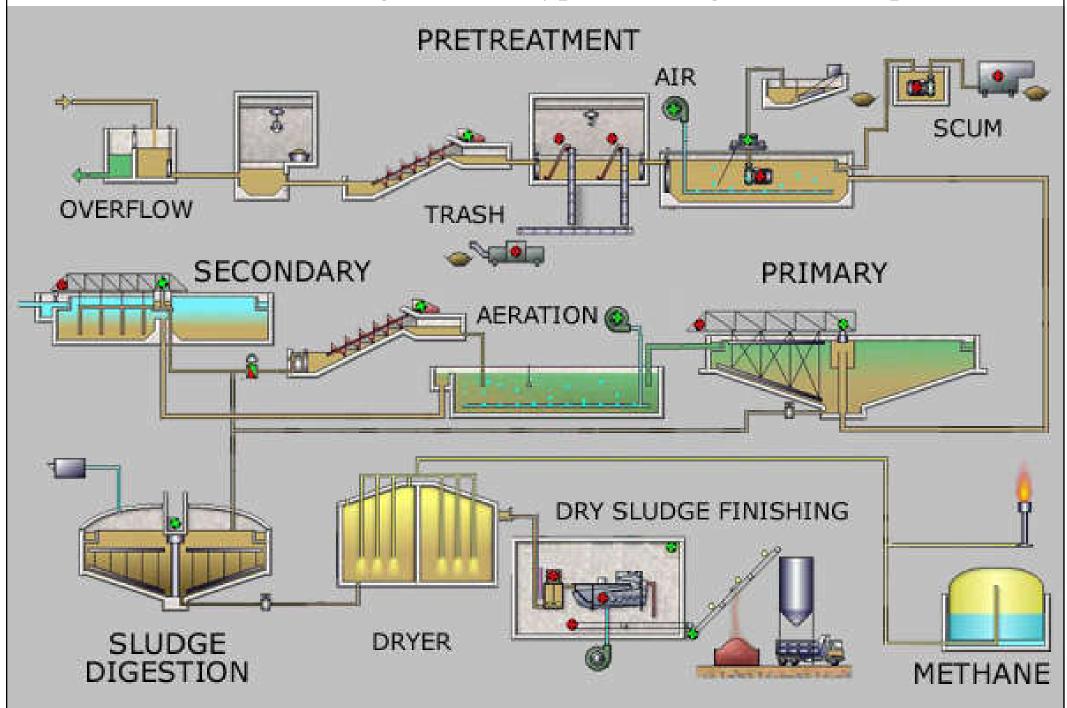

Video: How do wastewater treatment plants work? (3:30) https://youtu.be/s8IVjQg7yno

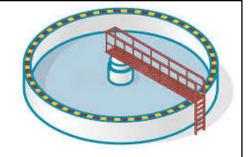

Diagrammatic representation of the process of sewage treatment

(Source: www.johnstonsmith.co.uk/fact16.html)

Process flow diagram for a typical sewage treatment plant

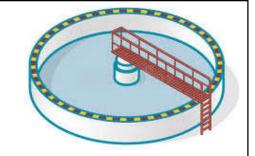

(Source: http://en.wikipedia.org/wiki/Sewage_treatment)

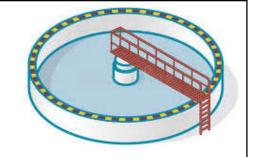

- Types of sewage treatment facilities in HK
 - Preliminary Treatment (Screening) includes screening and removal of grit (remove solids > 6 mm in diameter)
 - Primary Treatment includes screening, removal of grit and a primary sedimentation process. Solid waste and settleable suspended solids are removed
 - Chemically Enhanced Primary Treatment (CEPT) chemicals are added to enhance the removal of suspended solids and the biochemical oxygen demand
 - Secondary Treatment the sewage is purified by means of a biological treatment process after the primary treatment has been completed. The organic matter is decomposed by micro-organisms
 - Tertiary Treatment the highest level of treatment

- Reclaimed water (再造水) trial scheme in HK
 - For flushing at public toilets in Ngong Ping & cable car terminal; at Shek Wu Hui, for toilet flushing & non-potable uses
 - Highly treated wastewater:
 - Clear in appearance, odourless and is safe for use
 - Contains a low level of nutrients (nitrogen and phosphorus)
 - Can be beneficial to plant growing (reduce fertilizer use)

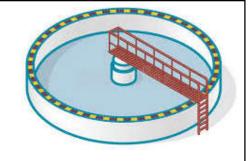

Water reclamation process in Hong Kong

- → Reclaimed Water Distribution System
- → Treated Effluent
- → Sewerage System

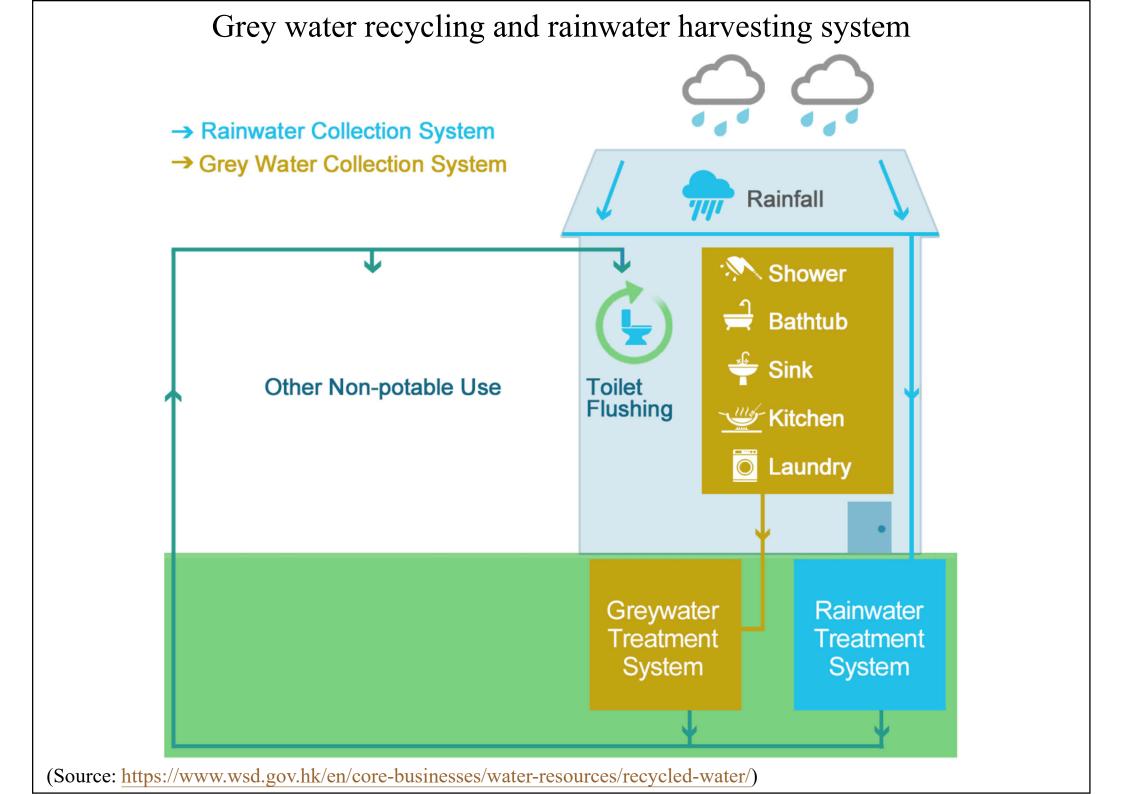

Example: Rainwater recycling system for house

- Grey water reuse & rainwater harvesting
 - Collection of grey water & rainwater
 - Collection & storage tanks, pumps
 - Treatment of grey water & rainwater
 - Assess quantity of supply & demand
 - Yield of grey water & rainwater
 - Estimate grey water & rainwater demand
 - Installation, operation & maintenance
 - Marking & proper use of treated reclaimed water

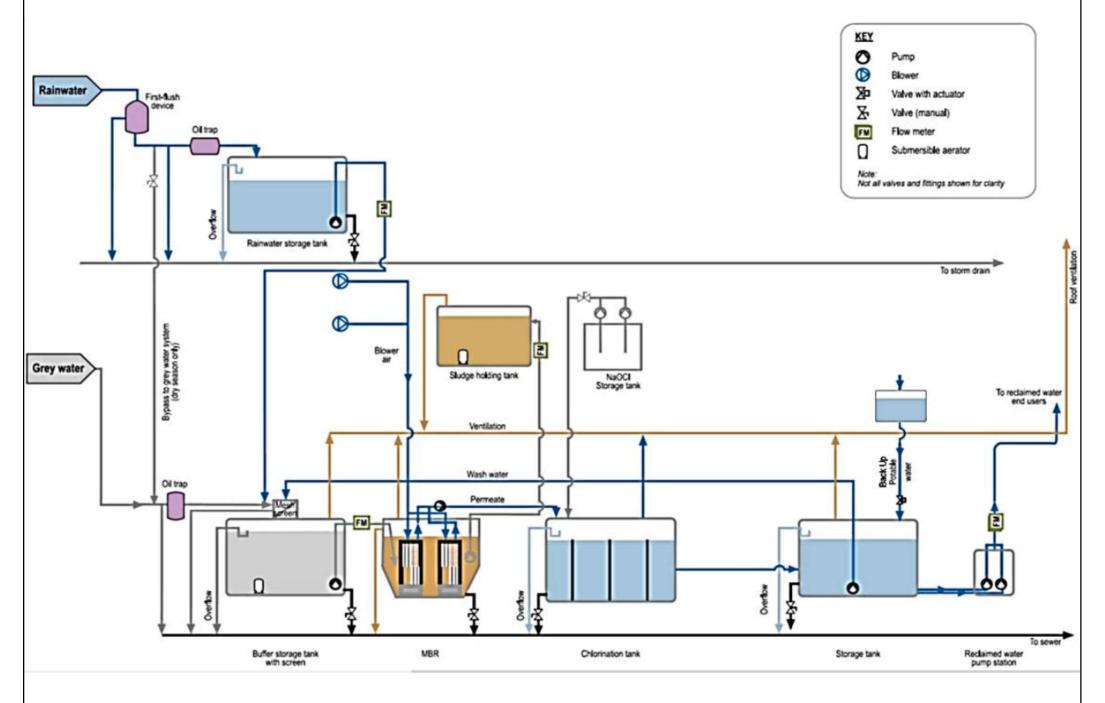

Grey water and rainwater sources and end uses

| Grey Water Sources | Rainwater Sources | Potential End Use After Treatment |
|--------------------------------------|--|--------------------------------------|
| • Wash basins | • Roofs | • Toilet flushing |
| • Baths | Permeable paving | Drip irrigation |
| • Showers | Non-permeable paving | Sprayed irrigation |
| Dishwashers | • Surface runoff from grass | Water features |
| Laundry machines | and landscaped areas | • Car washing |
| Kitchen sinks | | • External cleaning |
| Air conditioning | | • Fire fighting |
| condense | | • Industrial processes |

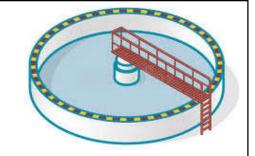

Treated grey water and rainwater (hereafter referred to as "reclaimed water") shall be prohibited from the following uses:

- (a) Consumed by humans or animals
- (b) Used for bathing or showering
- (c) Used to top-up swimming pools or spas
- (d) Used for food preparation or washing dishes or kitchen appliances
- (e) Used for irrigating in a way that will contact edible parts of herbs, fruit, or vegetables
- (f) Piped to hot water services

Schematic diagram for combined grey water & rainwater treatment

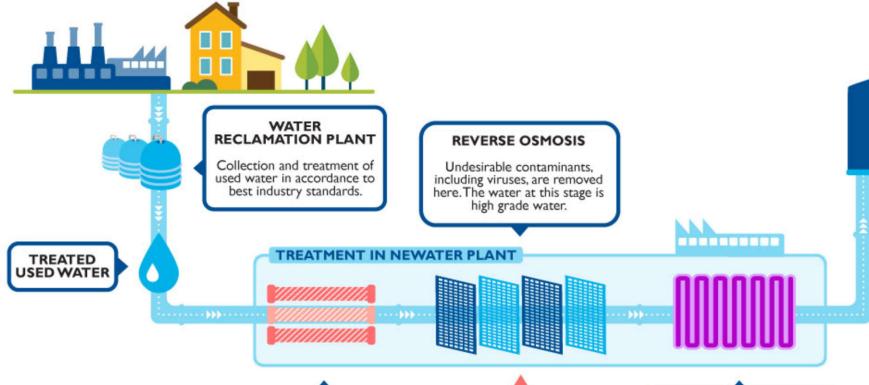

(Source: Technical Specifications on Grey Water Reuse and Rainwater Harvesting 重用洗盥污水及集蓄的雨水技術規格 https://www.wsd.gov.hk/filemanager/en/content 1459/technical spec grey water reuse rainwater harvest.pdf)

- Reclaimed water (再造水) (cont'd)
 - Benefits: better use of treated wastewater, save water, protect our environment, better quality water for irrigation
- In Singapore, the brand name is NEWater (新生水)
 - High-purity reclaimed water
 - Treated wastewater purified using dual-membrane (via microfiltration and reverse osmosis) and ultraviolet
 technologies, in addition to the water treatment processes
 - The water is potable and is consumed by humans
 - But is mostly used for industry requiring high purity water

NEWater technology in Singapore

MICROFILTRATION / ULTRAFILTRATION

Microscopic particles including bacteria are filtered out at this stage.

ULTRAVIOLET DISINFECTION

The water passes through ultraviolet light, which is capable of killing both bacteria and viruses, as an additional safety measure to guarantee the purity of NEWater.

NEWater is ultra-clean. high-grade recycled water that is produced using advanced membrane technologies. It has passed more than 150,000 scientific tests and is well within the World Health Organisation Guidelines for Drinking-Water Quality. It is entirely wholesome and safe to drink.
