Computer-aided design

- Lighting designers often use computer software as a design tool to complement & contribute to the design process
  - Perform simple calculations, develop lighting concept & strategy (for design/control)
  - Assist in space analysis, lighting layouts, or specification of lighting products
  - Provide photo-realistic rendering & visualization
  - Check compliance with building energy codes & green building rating systems (e.g. LEED)

Conceptual energy analysis: study how the sun affects the design

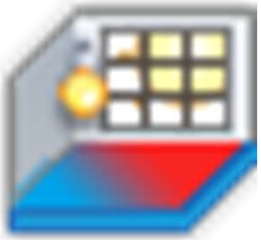
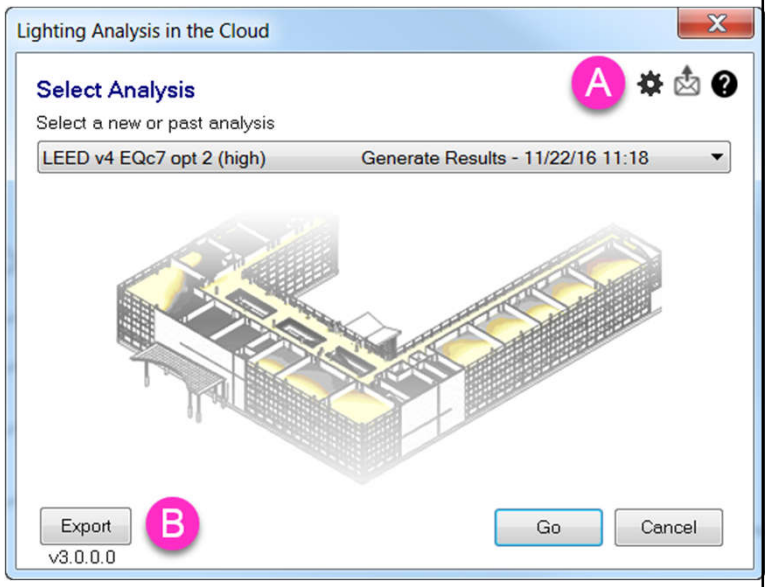
Computer-aided design

- Lighting design tools: practical application
  - Building information modelling (BIM)
    - BIM & AutoCAD library files for lighting products
    - Digital model & platform for design coordination
    - Information about building geometry, lighting products & mounting positions (BIM workflow integration)
  - Lighting analysis & simulation
    - Calculations, simulation/modelling & visualization
  - Lighting product plug-ins (from manufacturers)
    - Technical data & information for design & installation
    - Databases & standard format

Computer-aided design

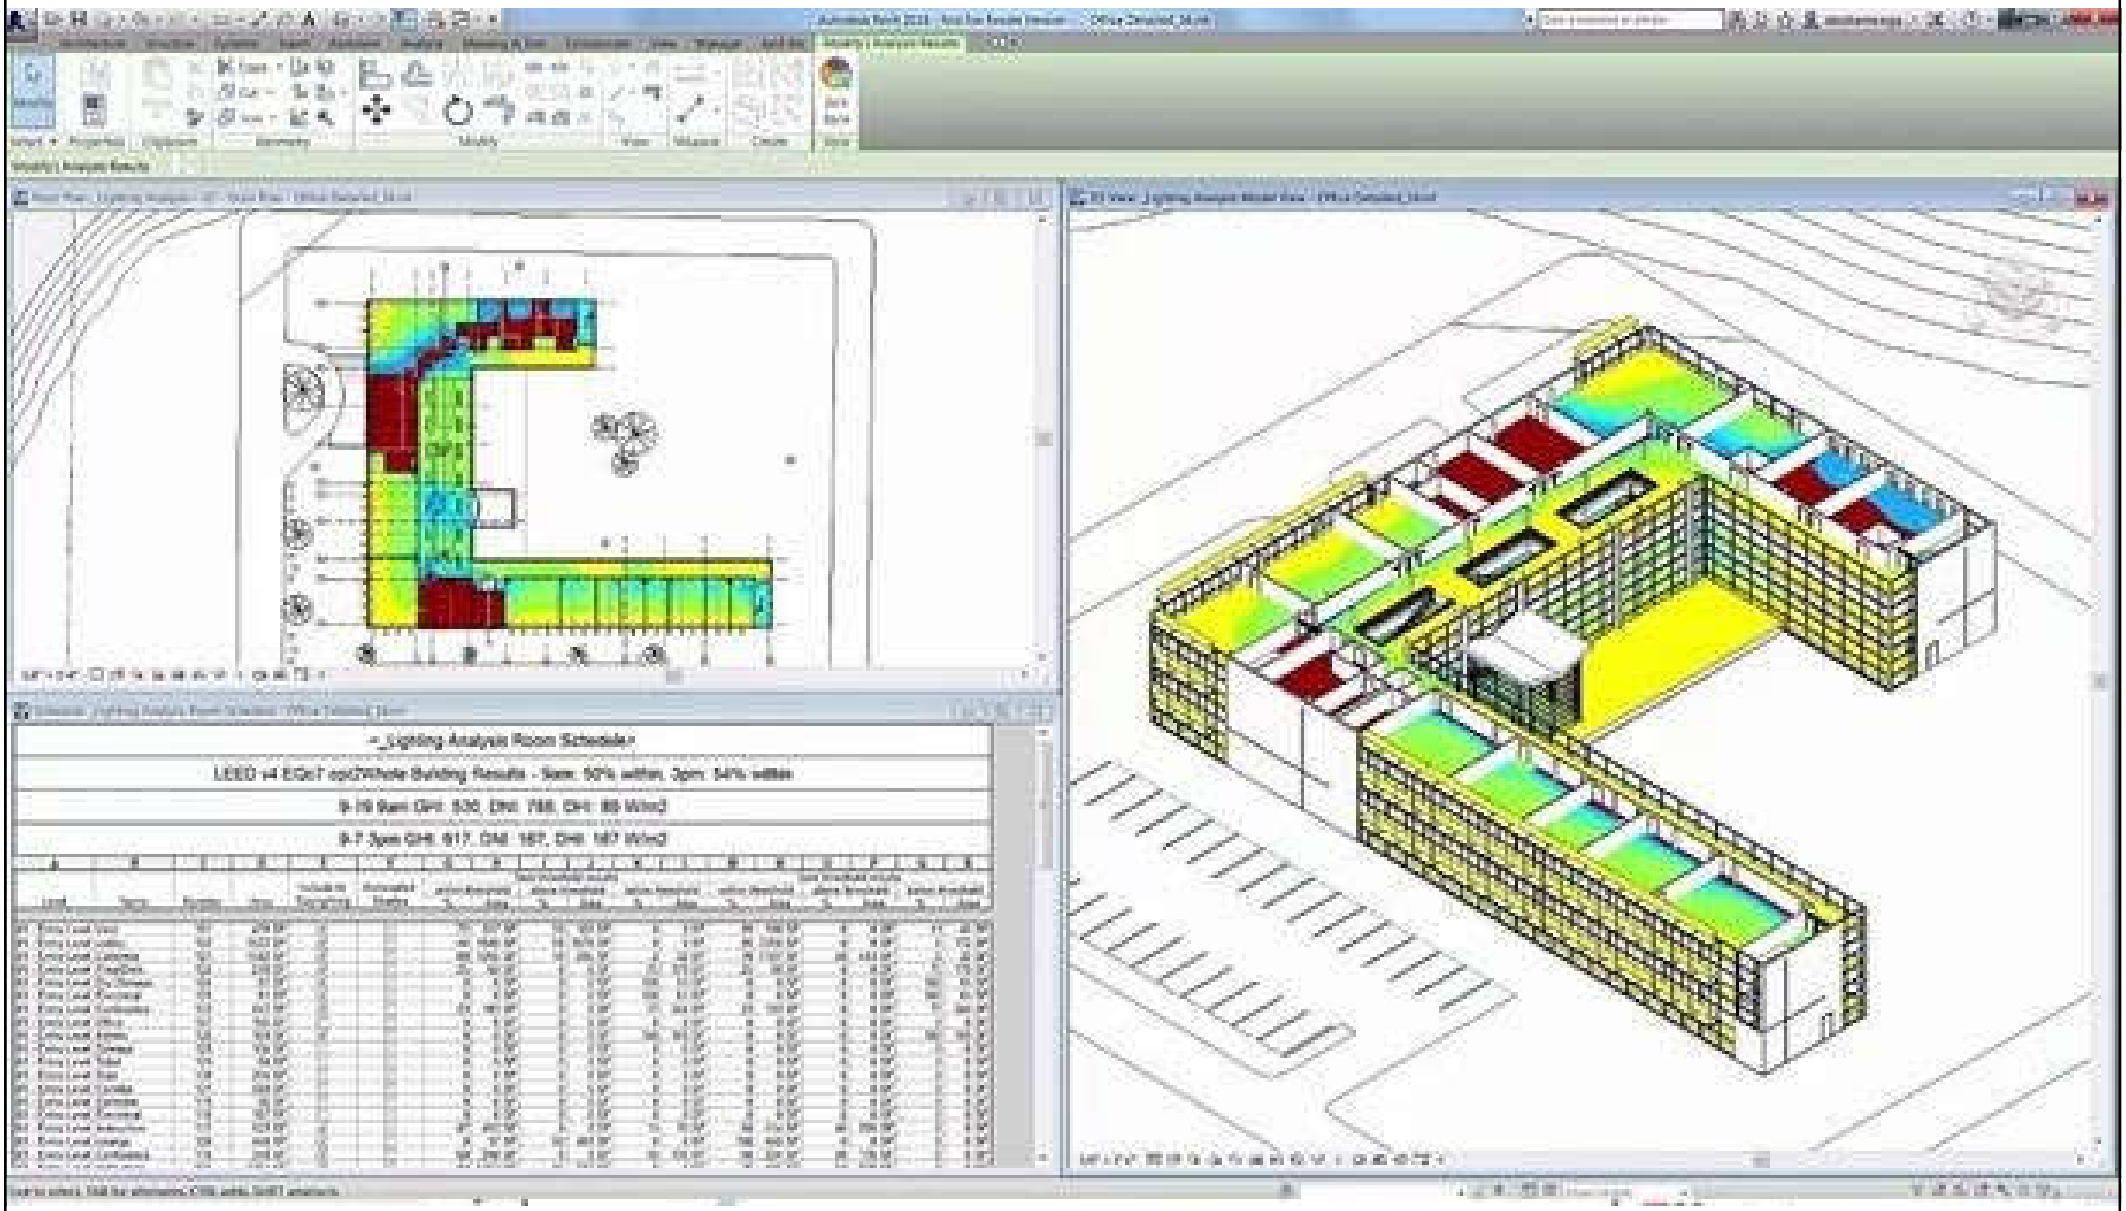
- Lighting & daylighting analysis with Revit
  - Applied to 3D & plan views of the BIM model
  - Use Autodesk A360 & Insight (in the cloud)
  - Types of analysis:
    - Illuminance analysis
    - Daylight factor
    - Spatial daylight autonomy (sDA)
    - Annual sunlight exposure (ASE)
    - LEED v4 EQc7 (sDA+ASE)
    - Solar access
  - 3D perspective illuminance rendering (in the cloud)





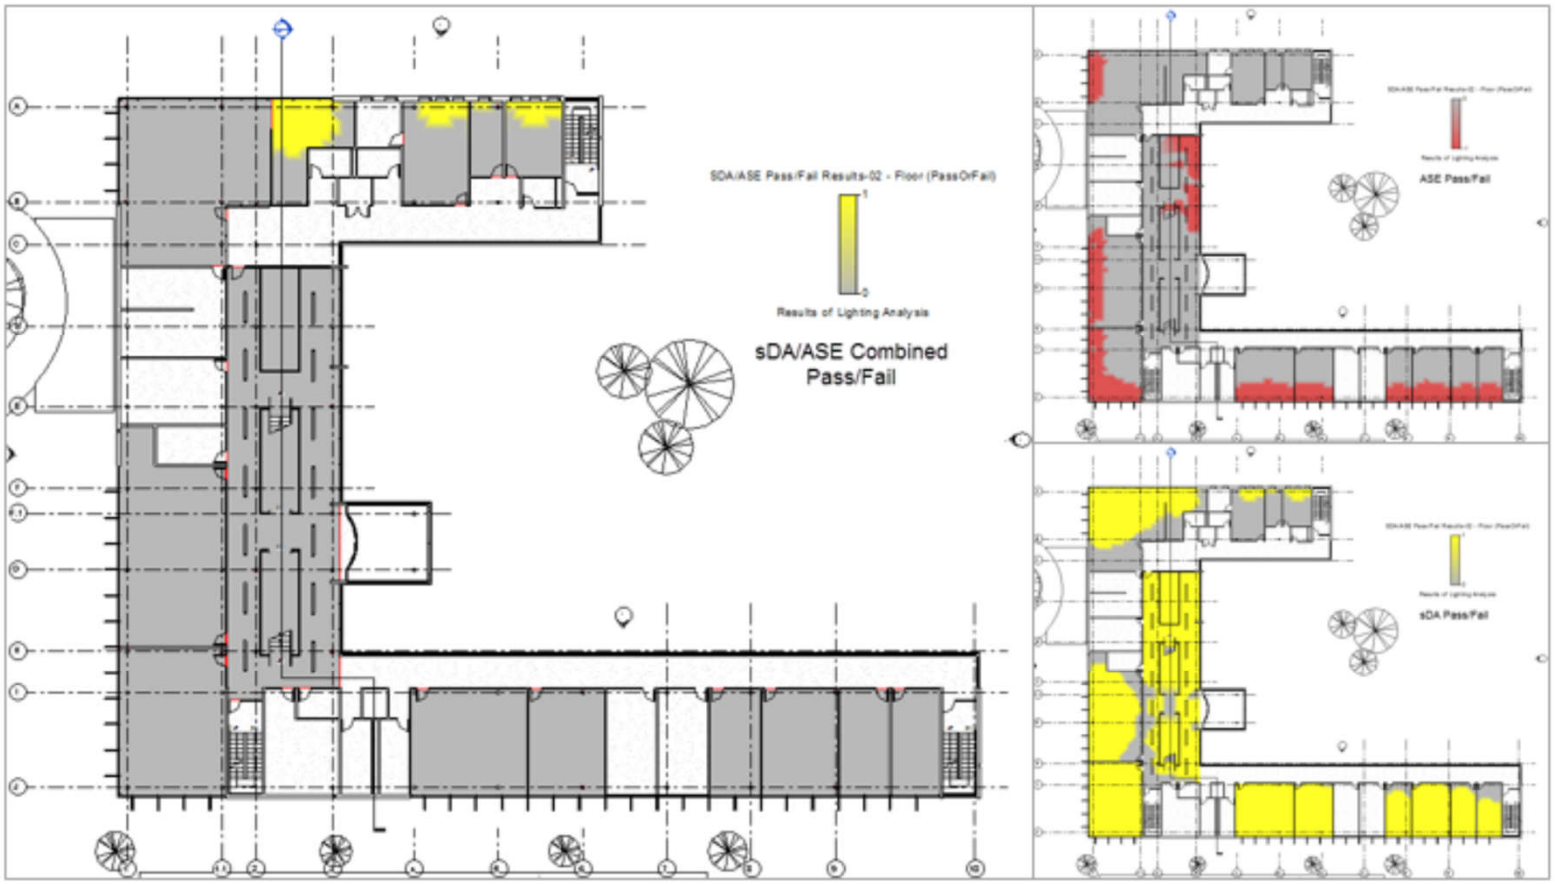
(Source: Insight lighting analysis https://parametricmonkey.com/2020/04/14/insight-lighting-analysis/)

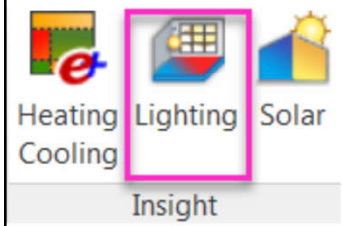
Daylighting analysis using Insight for Revit (cloud-based)



(Source: Autodesk)

Insight Lighting Analysis to produce spatial daylight autonomy (sDA) & annual sunlight exposure (ASE) results according to LEED v4 EQc7





<_Lighting Analysis Room Schedule>

LEED Daylight Autonomy Results Summary: Manchester, NH

3% of Building Area meets sDA & ASE for 8:00am - 6:00pm, January 1 - December 31

LEED points for % Building Area >sDA300/50 in Rooms with ASE1000/250 < 10% of Room area - 55% (2 pts) or 75% (3 pts)

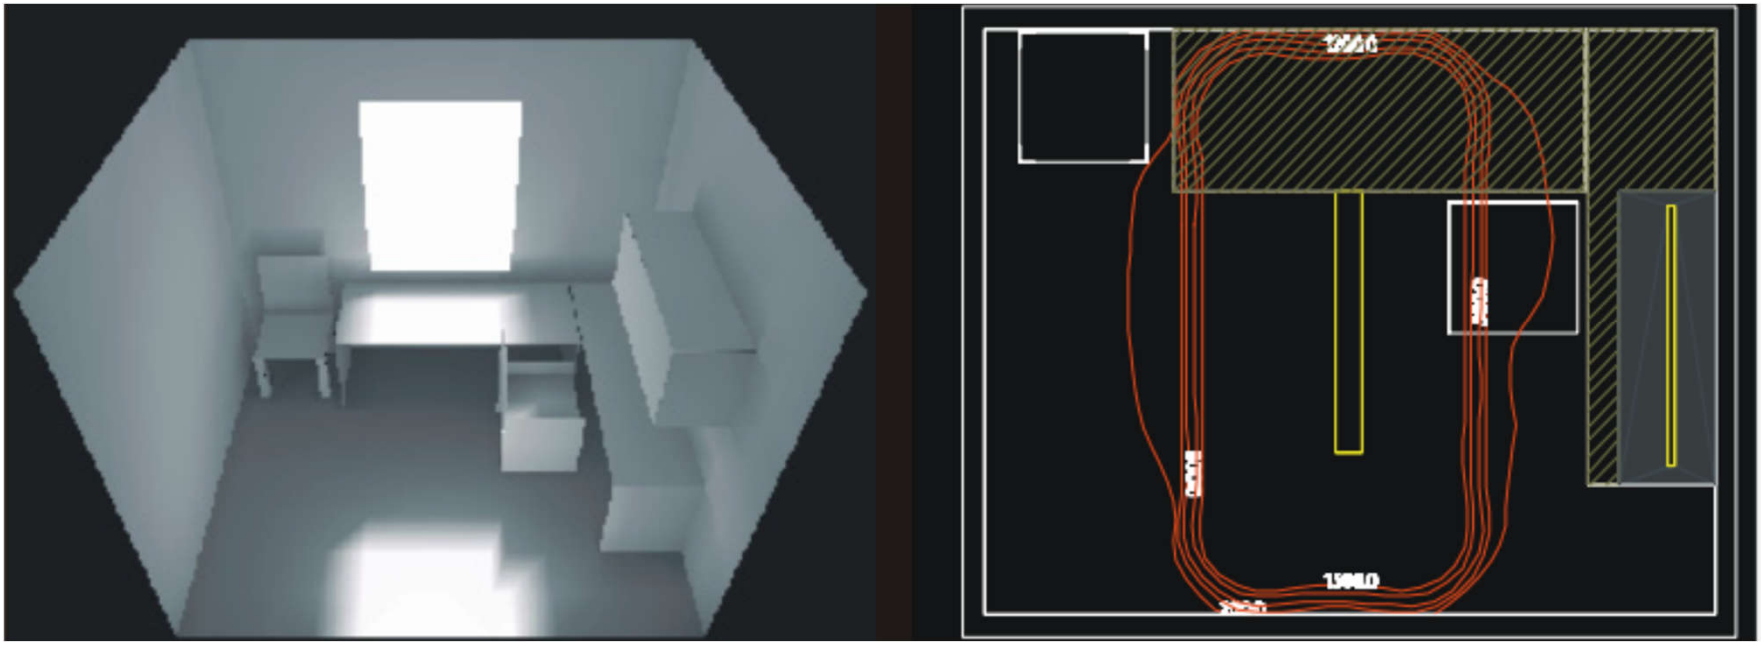
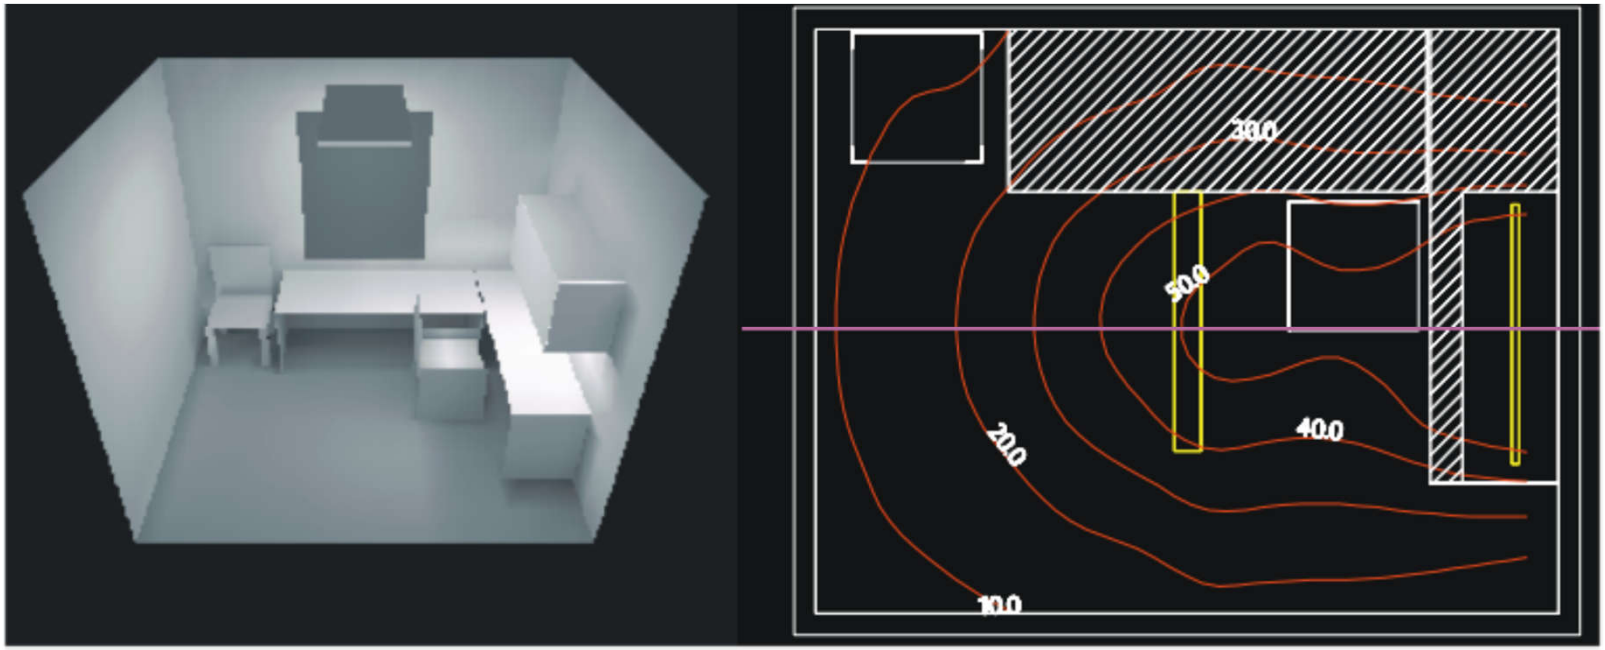
Practical examples

- 1. Private office & small work rooms
  - With a window for admitting daylight
  - General lighting (on ceiling): recessed indirect luminaire, two F32 T8 lamps
  - Task light: under cabinet, one F25 T8 lamp
  - Analyse light distribution at daytime & nighttime
- 2. Open office plan areas
  - Gray-scale rendering: daytime, daylight + electric light; evaluate the design & control strategies

Daylighting distribution, private office at daytime

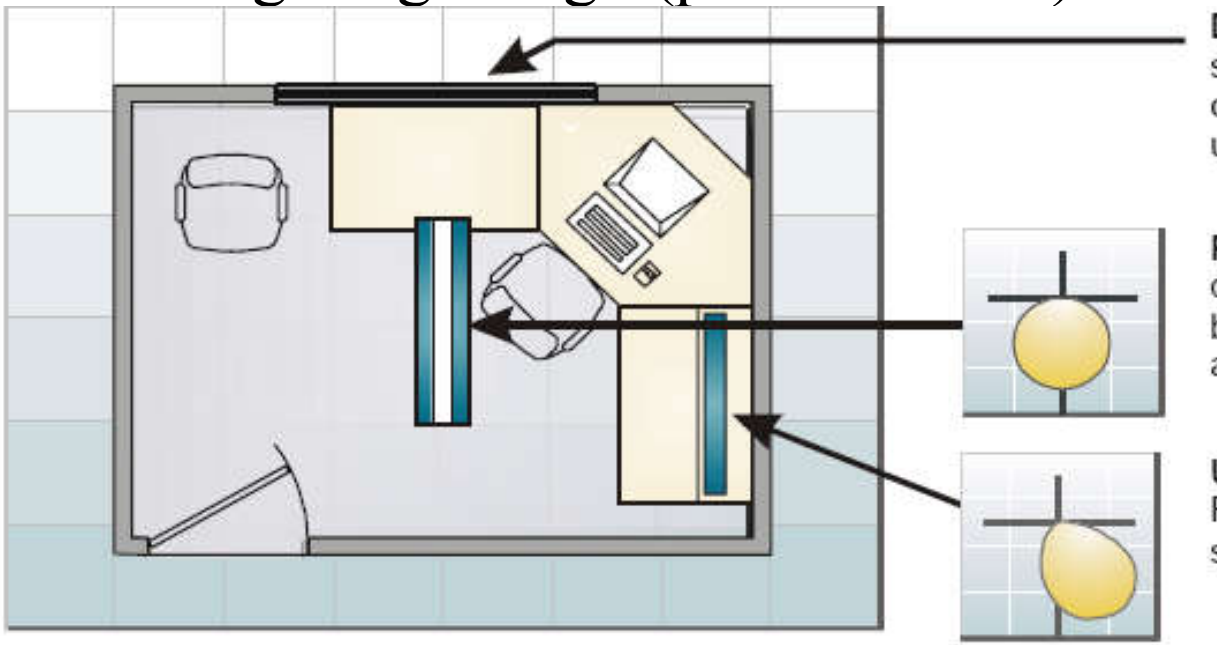


Electric lighting distribution, private office at night



(Source: Advanced Lighting Guidelines 2003)

Lighting design (private office) with one luminaire in ceiling

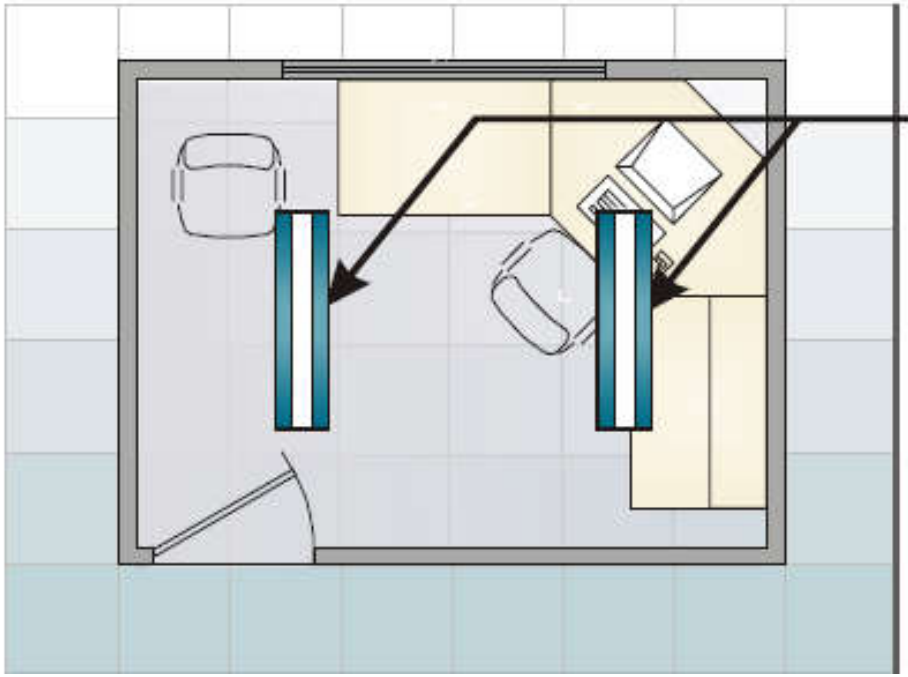


Daylight, from window with horizontal blinds, provides sufficient ambient light in space for part of the day and controls direct glare by directing direct beam sunlight upwards towards ceiling.

Recessed "indirect" basket luminaire produces direct light using two F32 T8 lamps and NLO/EE ballast. Dimming electronic ballasts allow for user and automatic photosensor control of light levels.

Under-cabinet task light, with one F25T8 lamp and RLO/EE ballast allows high illumination levels at task surface. User control or occupancy sensor.

Lighting design (private office) – alternate design with two luminaires



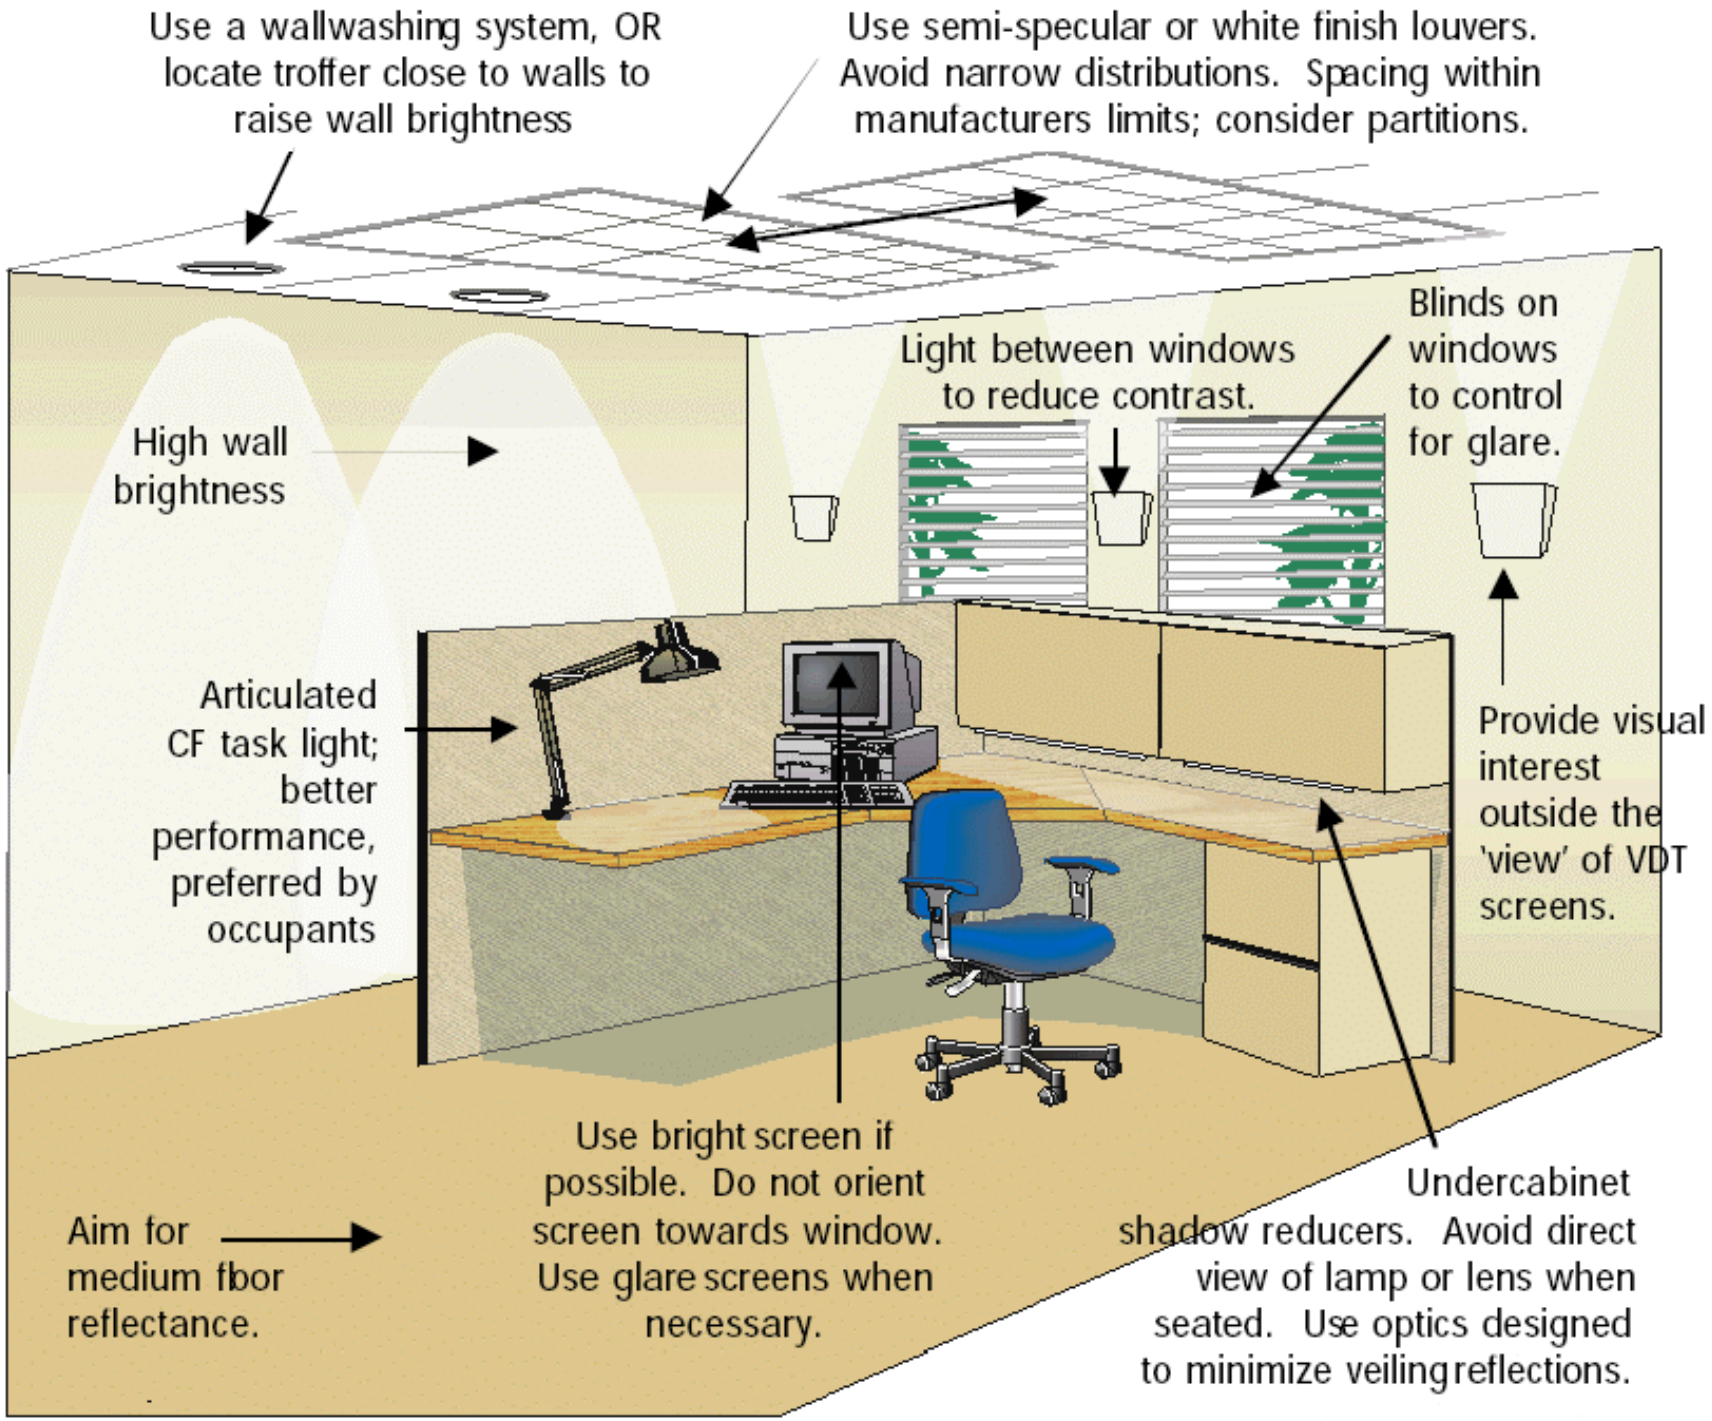
Alternate design using two recessed "indirect" basket luminaires, spaced about 6' apart, each with a single F32 T8 lamp and wired in tandem to a single NLO/EE ballast, distributes light more evenly over entire area but costs more.

(Source: Advanced Lighting Guidelines 2003)

Example of lighting design (open plan office)

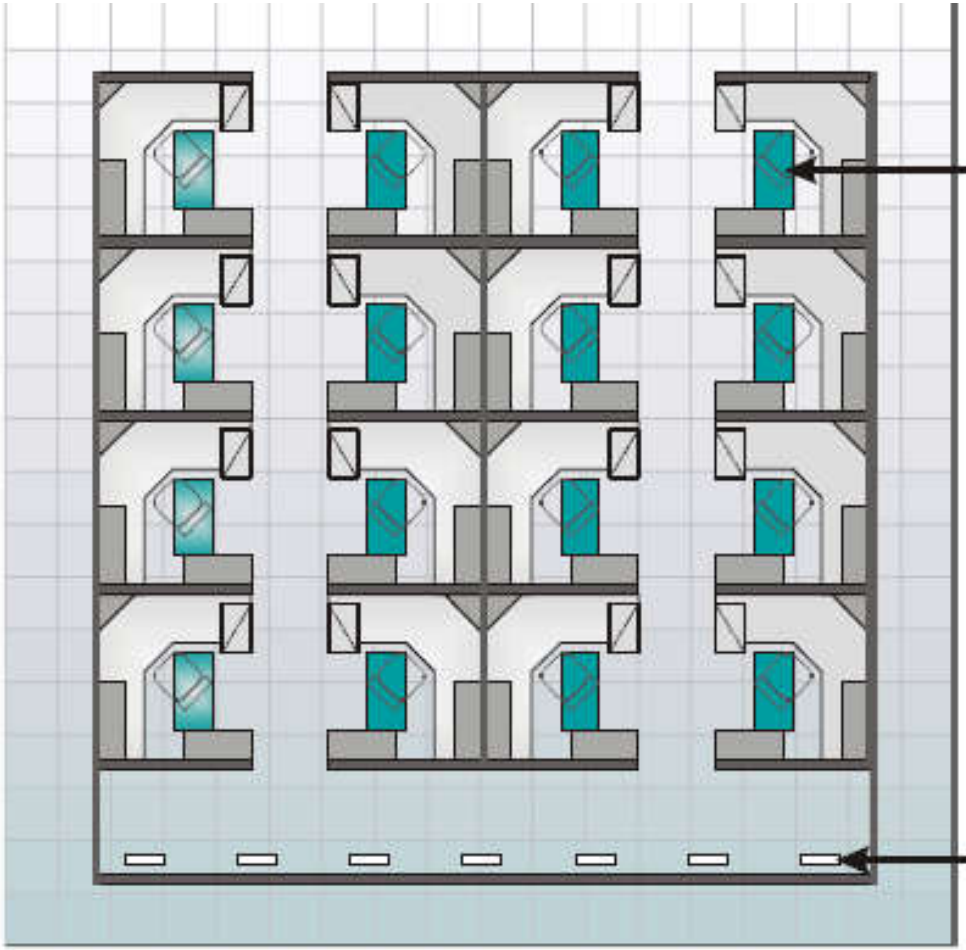
(Source: Advanced Lighting Guidelines 2003)

Lighting quality recommendations for open plan spaces



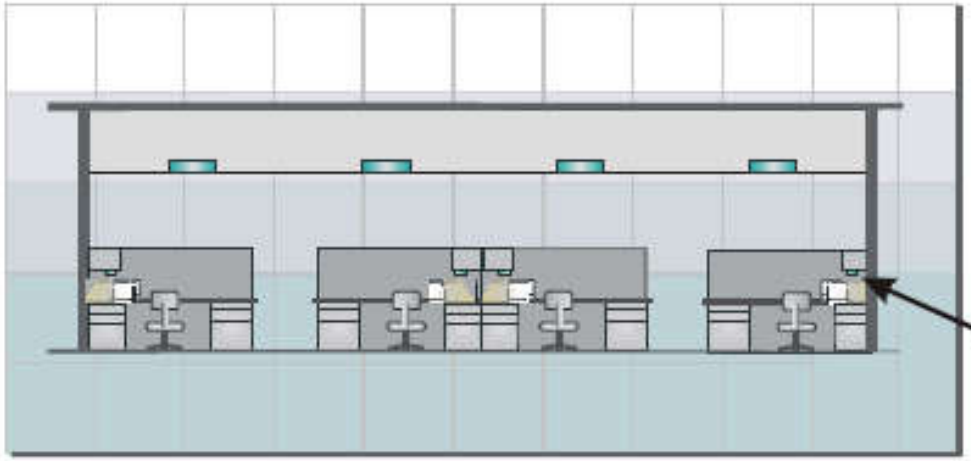
(Source: *Federal Lighting Guide*, USDOE, June 1998)

Lighting design for open plan office



Recessed parabolic 2x4 louver troffers with F32T8 lamps direct light downward over each workstation. Individual dimming ballasts allow worker control of task area light levels.

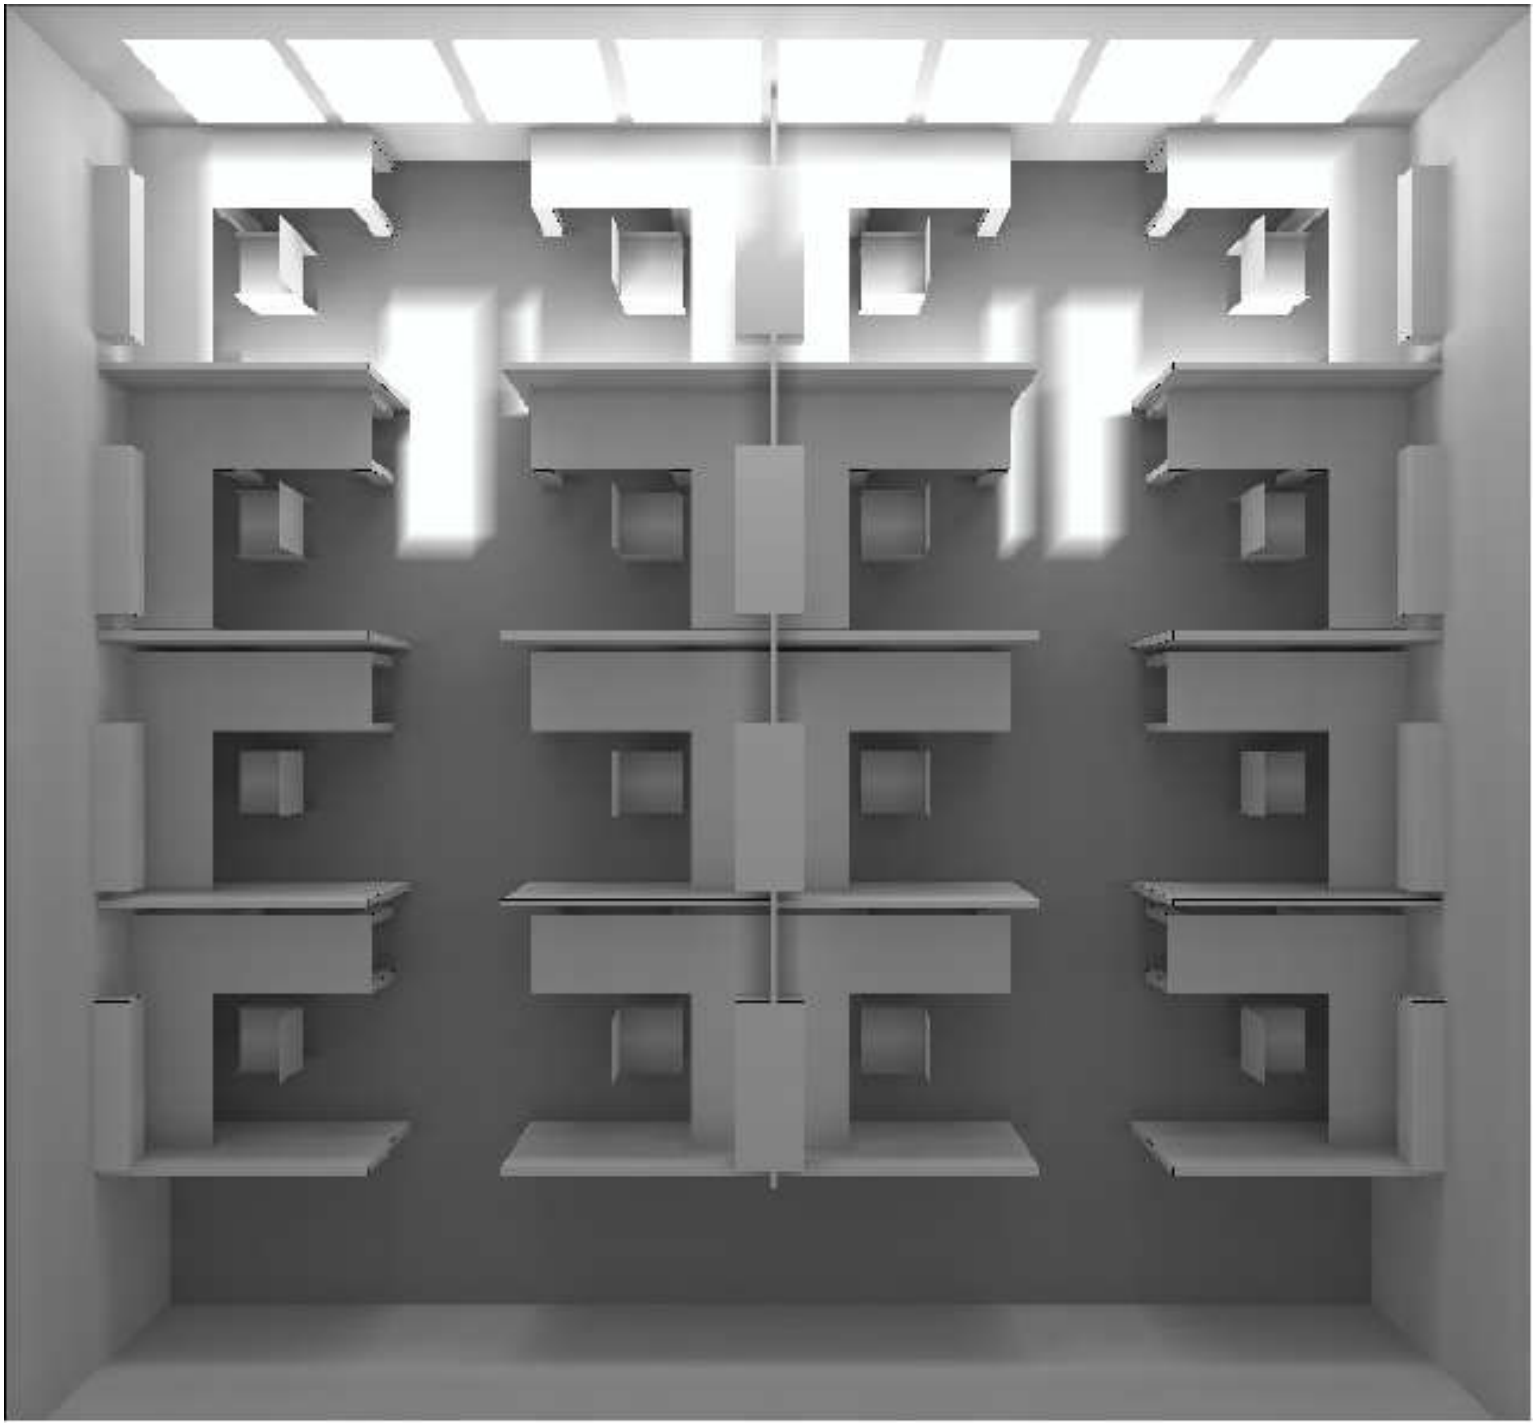
Recessed linear wallwashers, each with one CF40T5 lamp, allow a uniform wash of light from top to bottom. Control with dimming ballasts and an adaptive compensation system that dims overhead lighting at night.



Undercounter task light, with one F25T8 lamp allows high illumination levels at task surface. User control or occupancy sensor.

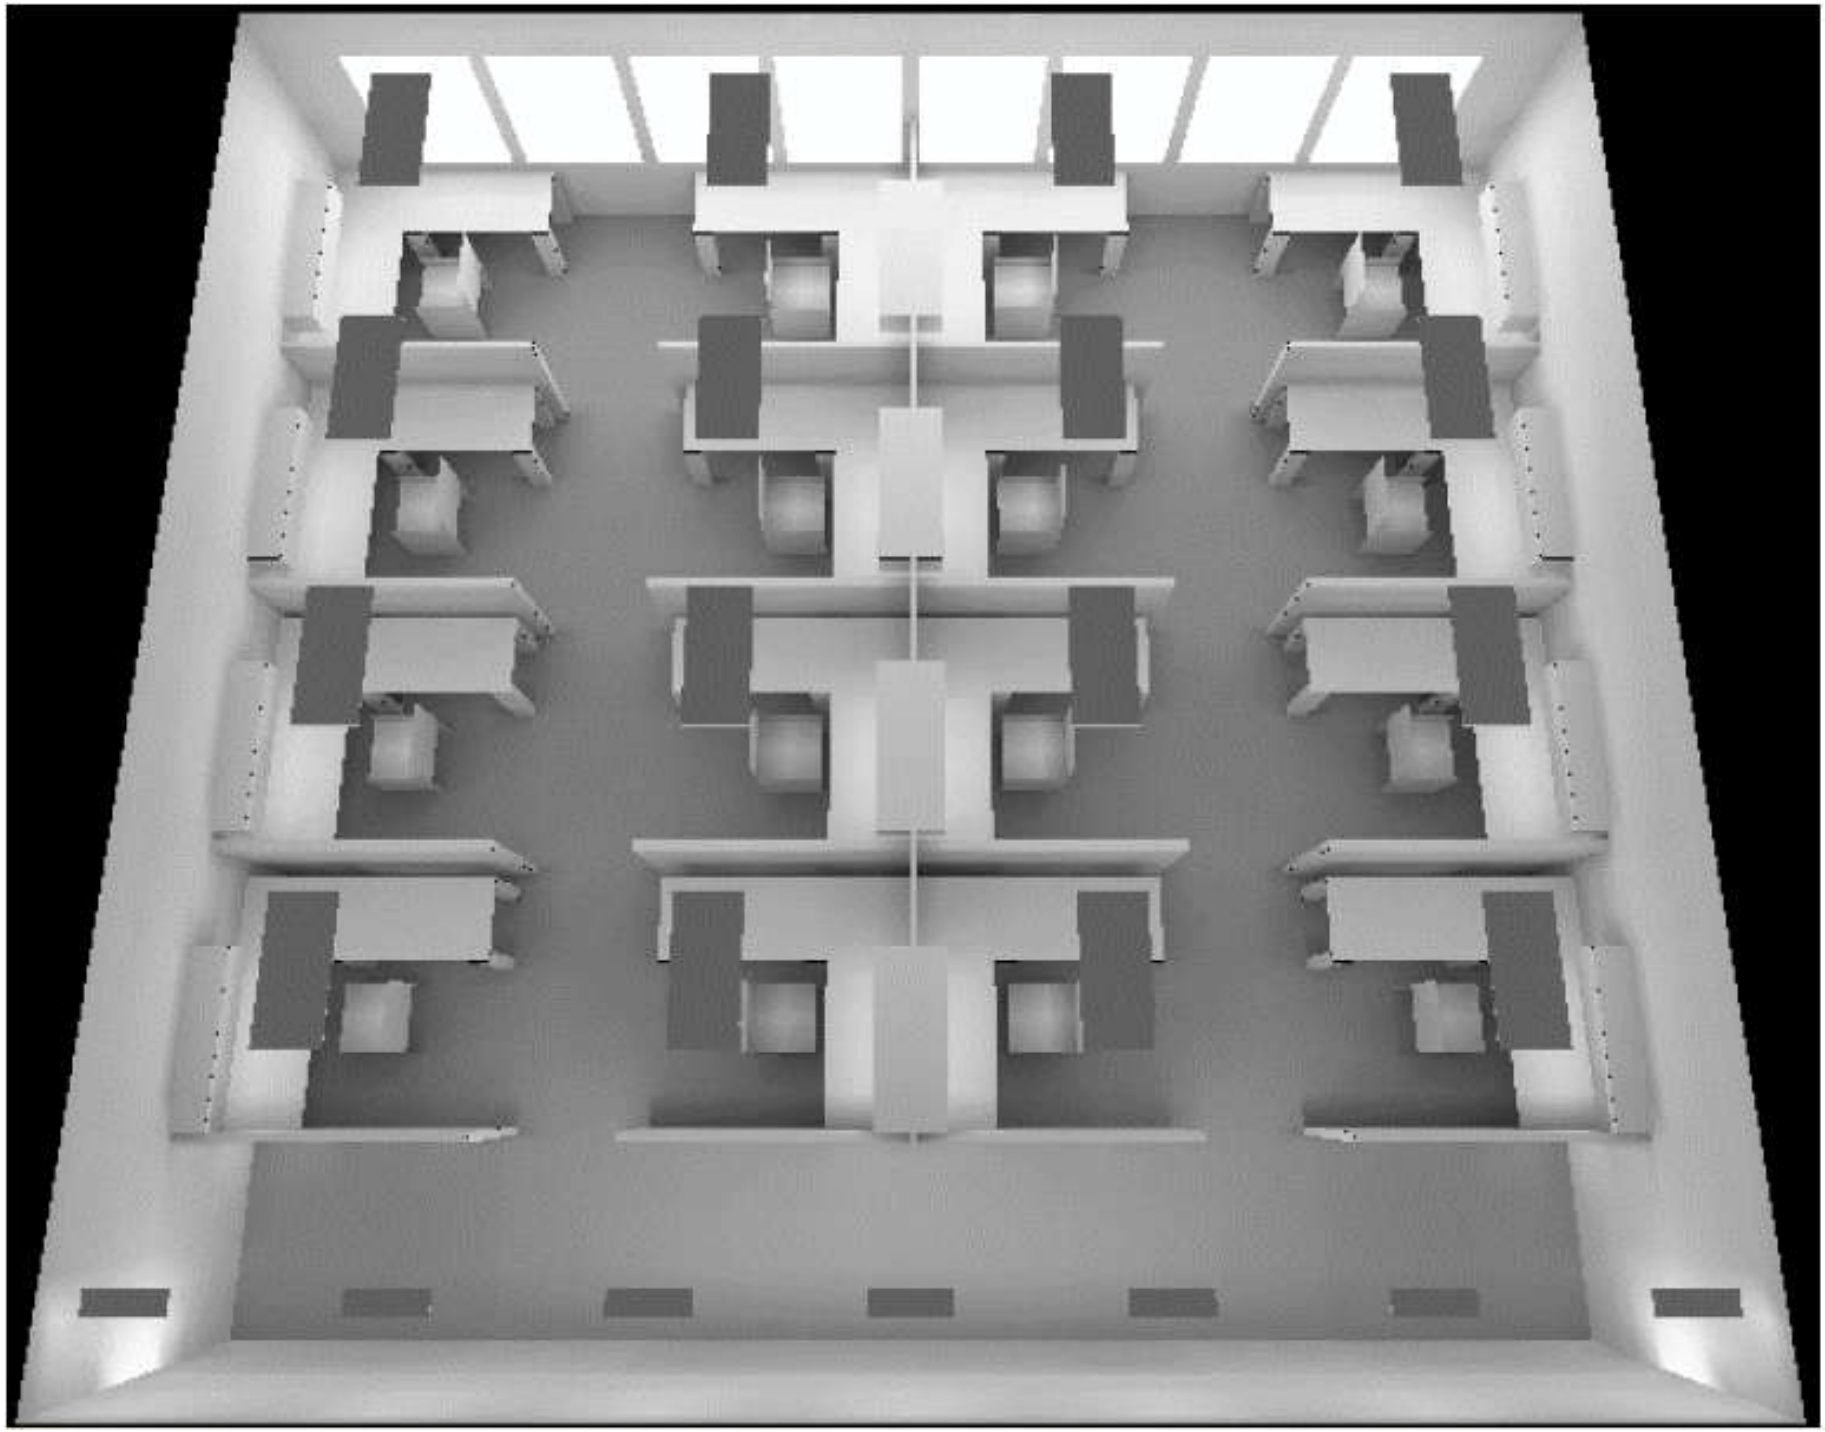
(Source: Advanced Lighting Guidelines 2003)

Gray scale rendering, open plan office (daytime)



(Source: Advanced Lighting Guidelines 2003)

Gray scale rendering, open plan office (daylight + electric light)



(Source: Advanced Lighting Guidelines 2003)

Lighting Strategies: Open Office 1

Strategy	Performance	Issues
Electric Lighting: (16) Parabolic 2x4 troffers with two F32T8 lamps, 48 W each. Task lighting using (16) undercabinet 25-W lights. Circulation areas illuminated by (7) wallwashers with CF40T5 lamps, 38 W each.	Using non-dimming, efficient electronic reduced light output (RLO) ballasts BF = 0.74–0.78, the LPD = 0.93 W/ft². The connected load is 1,418 W.	Assumes 2,700 hrs/yr use = 2.6 kWh/f2 per year, annual energy cost is about $0.25/ft² for lighting plus an amount for HVAC up to about $0.08/ft². Task lighting may be T-8, T-5, or T-2.
Minimal control: Separate manual switching near window areas. Local zone override switches or overhead occupancy sensors. "Sweep" system automatic shutoff at night.	Daylit zone switching can reduce lighting power by 50% in the space if used.	The suggested 2,700 hour annual use assumes motion sensing. Manual daylight control has been shown to be predictable, but savings will be modest.
Good control: Manual controls with automatic shutoff. Automatic daylight dimming for luminaires near windows.	The connected load will rise slightly because dimming ballasts tend to be 1.00 BF. The new connected load with all dimming ballasts will be 1,716 W, LPD = 1.12 W/ft²	Automatic balancing of light levels near windows when daylighting is abundant. With daylight zone dimming only, energy reduction will be about 25% annually compared to not dimming. Annual energy is estimated at about 0.65 (2,700 hours x 1.12 W) = 1.96 kWh per year per ft²
Optimal control: Manual controls with zone adaptive dimming and automatic shutoff on all troffers. Individual remote dimming control of overhead luminaires. Occupancy sensor for task lights, plug strip control in each workstation	As above.	Progressive, multi-zone daylight dimming allows dimming of interior zone some portion of the time. Approximate energy reduction will be about 42% annually. Annual energy is estimated at about 0.50 (2,700 hours x 1.12 W) = 1.96 kWh per year per ft² Including plug strip controls, the impact is estimated at 40% for 22% of the lighting load, making the total energy savings about 50% annually compared to the base design.

Lighting software

- Many of the lighting calculations can be carried out using a computer software, spreadsheet or online tools
- Common software for lighting designers:
  - 1. Manufacturers' programmes, normally linked to detailed databases of their own equipment
  - 2. General design programmes without links to any particular lighting manufacturer
  - 3. Advanced programmes with simulation & visualisation (rendering) techniques

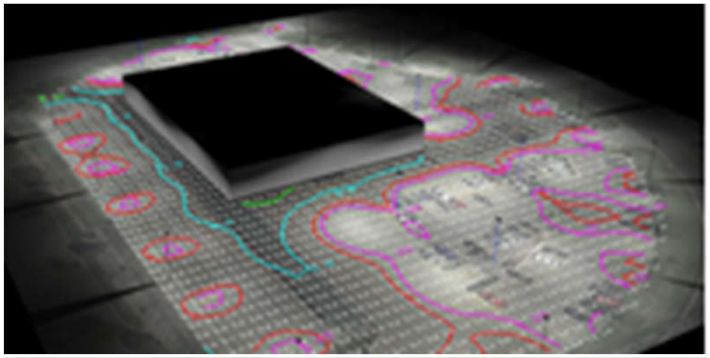
Lighting software

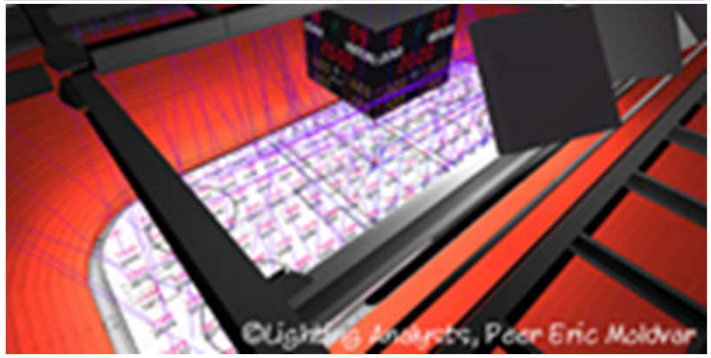
- Types of lighting related software:
  - 1. Lighting design software (e.g. AGi32, Calculux, DIALux, Radiance, Relux, Visual3D)
  - 2. Modelling & rendering software (e.g. Autodesk Maya, Blender, Houdini, Modo, Zbrush)
  - 3. Software for graphic resources (e.g. Adobe Photoshop, Adobe Illustrator, Autodesk 3ds Max, Paintshop Pro, SketchUp)
  - 4. Other tools (e.g. economic analysis, code compliance, photometric viewer)

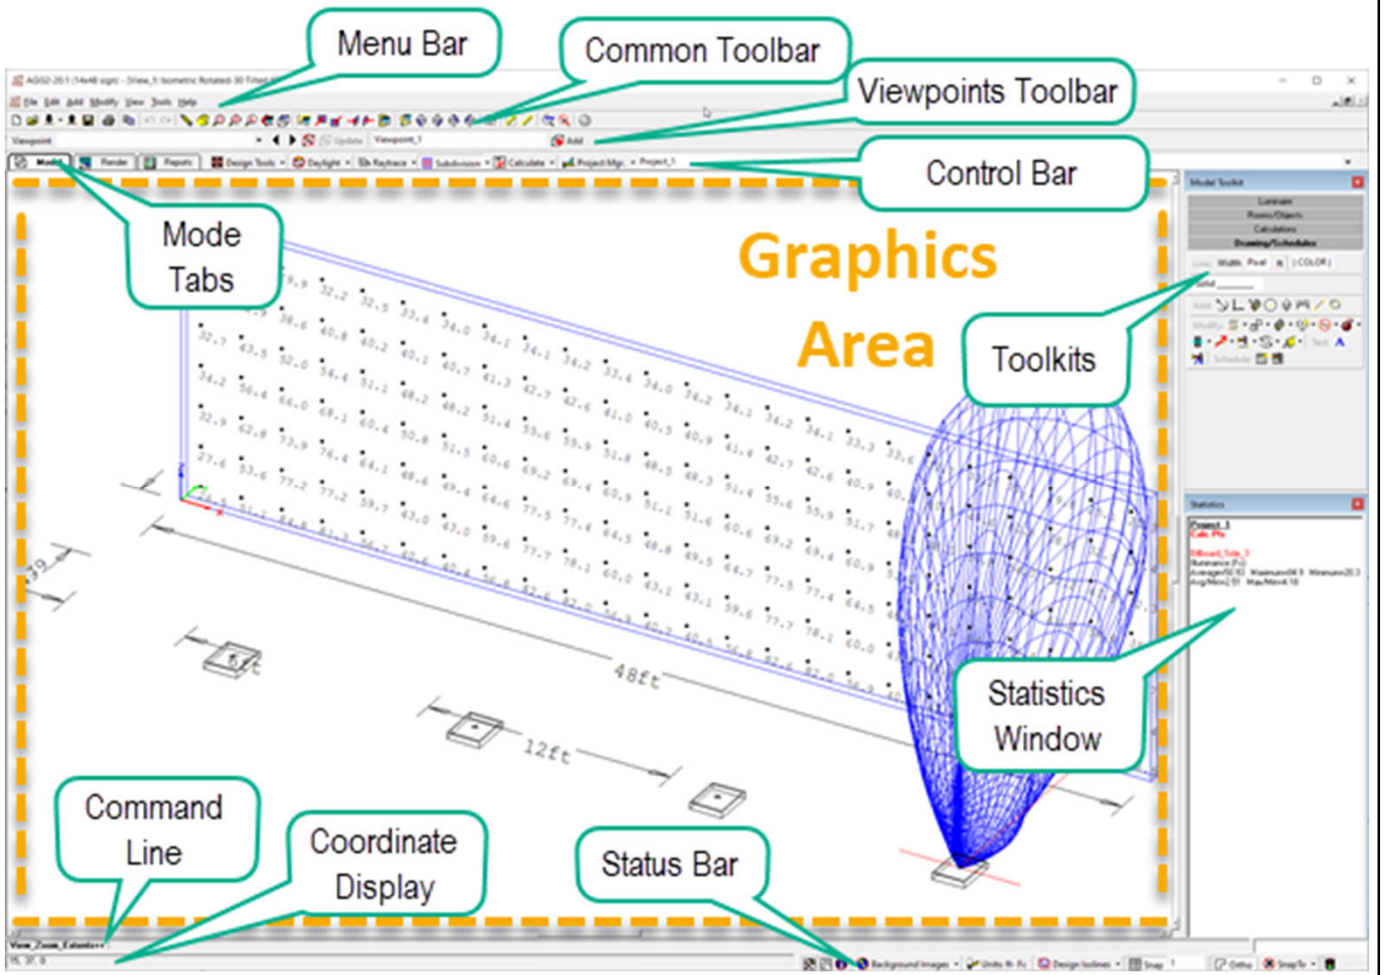
Lighting software

- Typical lighting design software:
  - AGi32 (from Lighting Analysts)
    - https://lightinganalysts.com/software-products/agi32/
  - Calculux (from Philips Lighting)
    - http://www.lighting.philips.cz/podpora/podpora-vyrobku/calculux
  - DIALux http://www.dial.de/
  - Radiance http://www.radiance-online.org/
  - Relux http://relux.com
  - Visual Lighting http://www.visual-3d.com/

AGi32 (Advanced Graphical Illumination/Interface)







(Source: https://lightinganalysts.com/software-products/agi32/; https://docs.agi32.com/AGi32/)

Lighting software

- Selected examples for study:
  - Calculux (from Philips Lighting)
    - “Calculux Indoor”: indoor lighting
    - “Calculux Area”: outdoor lighting
  - DIALux
    - Professional lighting software
    - For calculating lighting layout
    - Perform simple rendering
  - Visual Lighting (from Lightolier)
    - Basic & Professional versions
    - Simple lighting design & modelling

Lighting simulation

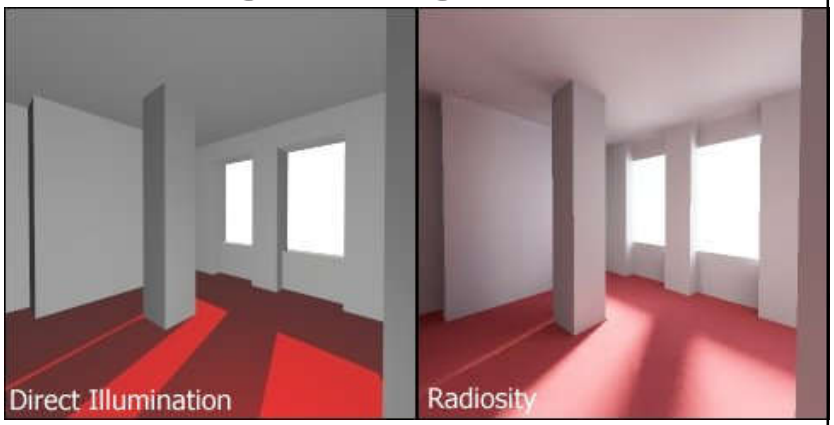
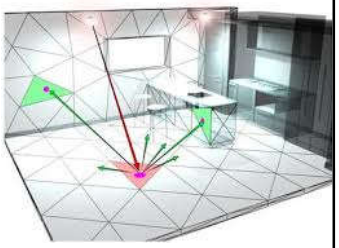
- Lighting simulation software depends on two important components to produce accurate calculations:
  - The selected light sources
  - The surfaces within the model
- Three methods of calculation for lighting simulation or rendering:
  - 1. Radiosity 輻射度演算法
  - 2. Raytracing 光線追蹤
  - 3. Photon mapping 光子映射



(Source: https://www.erco.com/en/guide/simulation-and-calculation/rendering-2685/)

Lighting simulation

- Radiosity 輻射度演算法
  - Divides each surface into small pieces (patches)
  - Each patch is calculated individually for the amount of light that enters or leaves that surface
  - Solves the system of equations in the model by determining the quantity of light on each patch as a result of the total sum of all the patches
  - This method works well for all matte model surfaces (perfectly diffusing), and it cannot include translucent, transparent & specular (shiny) surfaces



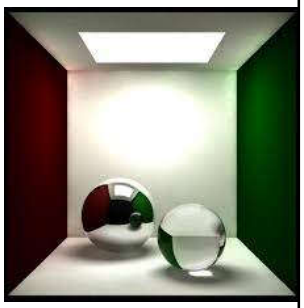
Lighting simulation

- Raytracing 光線追蹤

  - A point-specific lighting calculation process
  - Calculation rays are sent outward from a particular viewpoint and the program follows each ray as it hits & reflects off different surfaces and divides into more rays
  - This method works for all object types including transparent, translucent & specular surfaces

  - Creates beautiful renderings & presentation-quality images (e.g. sparkle on specular materials)
  - View dependent & greater computational cost

Lighting simulation



- Photon mapping 光子映射
  - Similar to the ray tracing process
  - While ray tracing is based on rays from the observers/camera position, photon mapping is based on rays emitted from the light source
  - Virtual “photons” radiating light into the room. When they hit a surface, they are reflected back & the luminance values are summated. The photon outputs are stored in a photon map
  - Render the image using the map
  - Can be combined with ray tracing

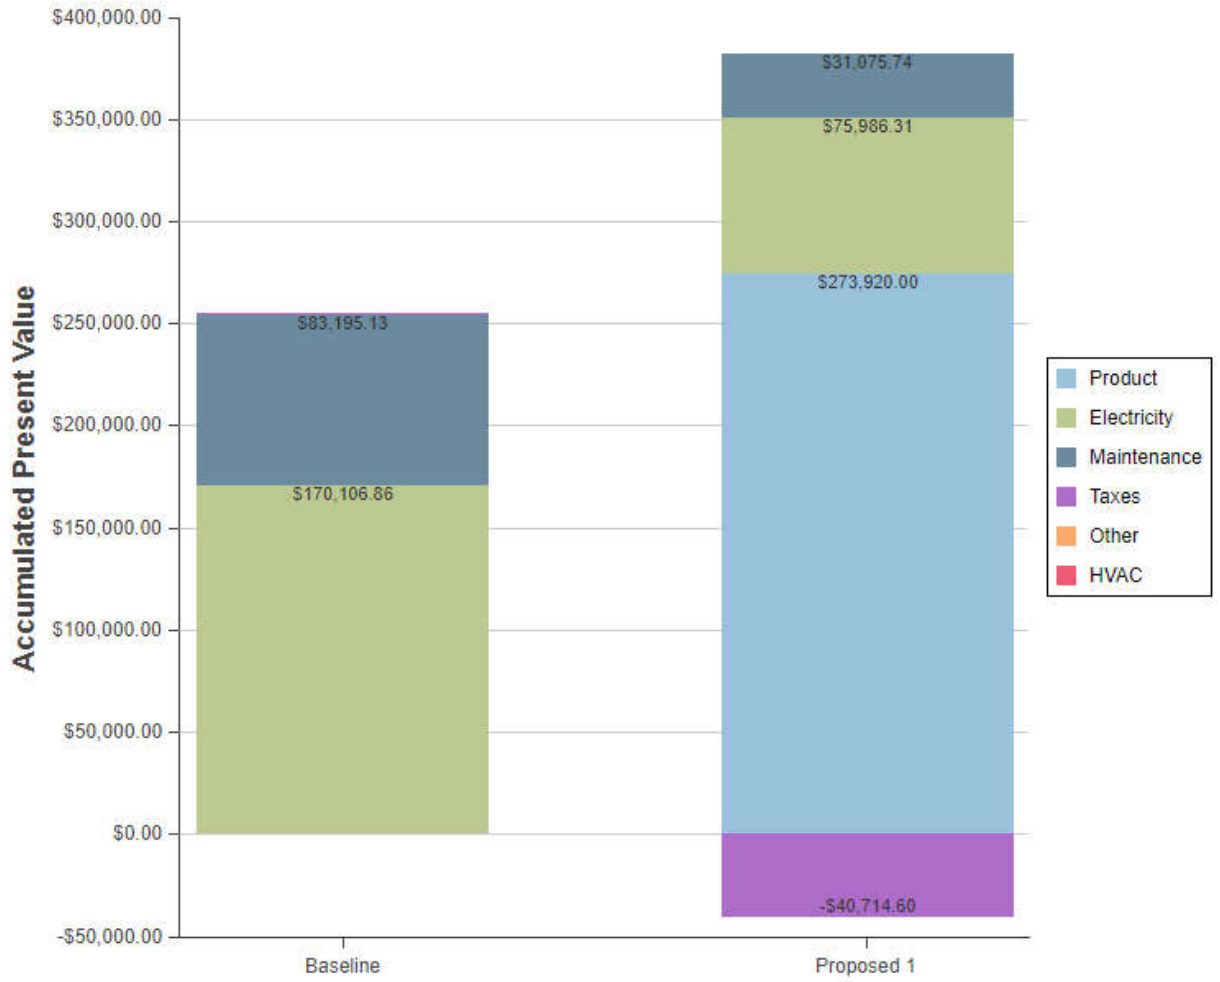
Designs | Groups | Spaces | Annual Details | Luminaires | FV vs PV | Design Audit (5)

By Category | By Year



Design Summary

Category	Baseline	Proposed 1
Initial Cost	$0.00	$288,288.20
Ave. Operation Cost (FV)	$28,713.47/Year	$6,710.69/Year
Total Operation Cost (PV)	$254,494.74	$51,979.25
Life Cycle Cost	$254,494.74	$340,267.45
Net Present Value	--	($85,772.71)
Simple Payback	--	No Payback
Discounted Payback	--	No Payback
Internal Rate of Return	--	--
