## Contents

Centrifugal Pumps

• Pump Arrangements

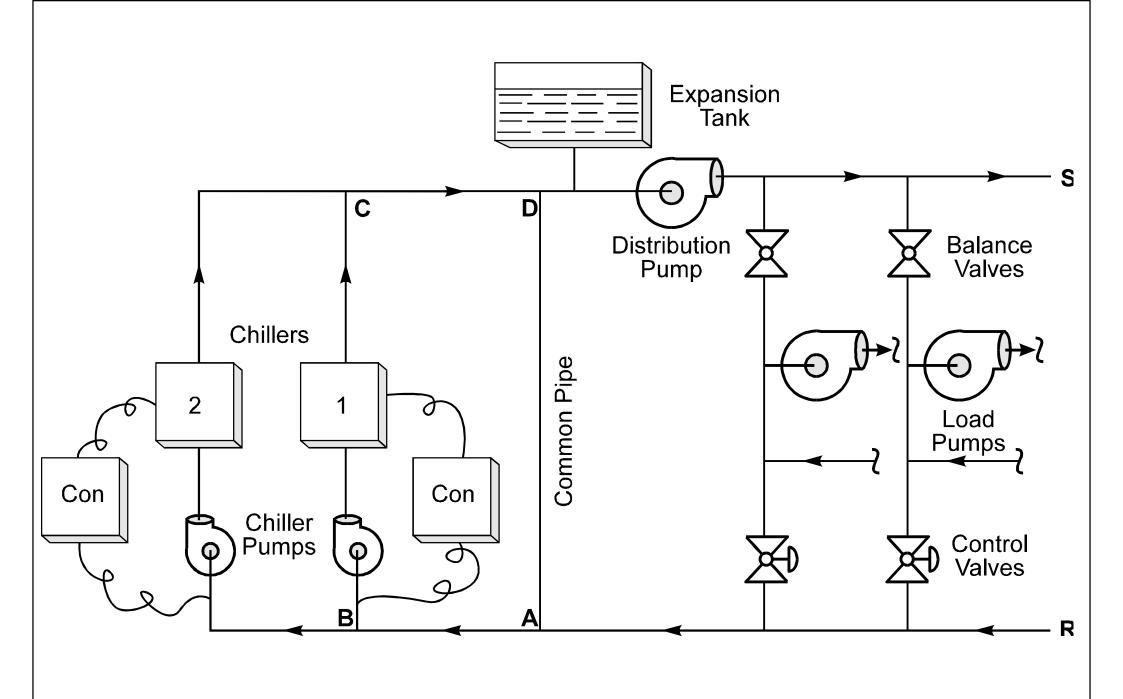

Matching Pumps to Systems

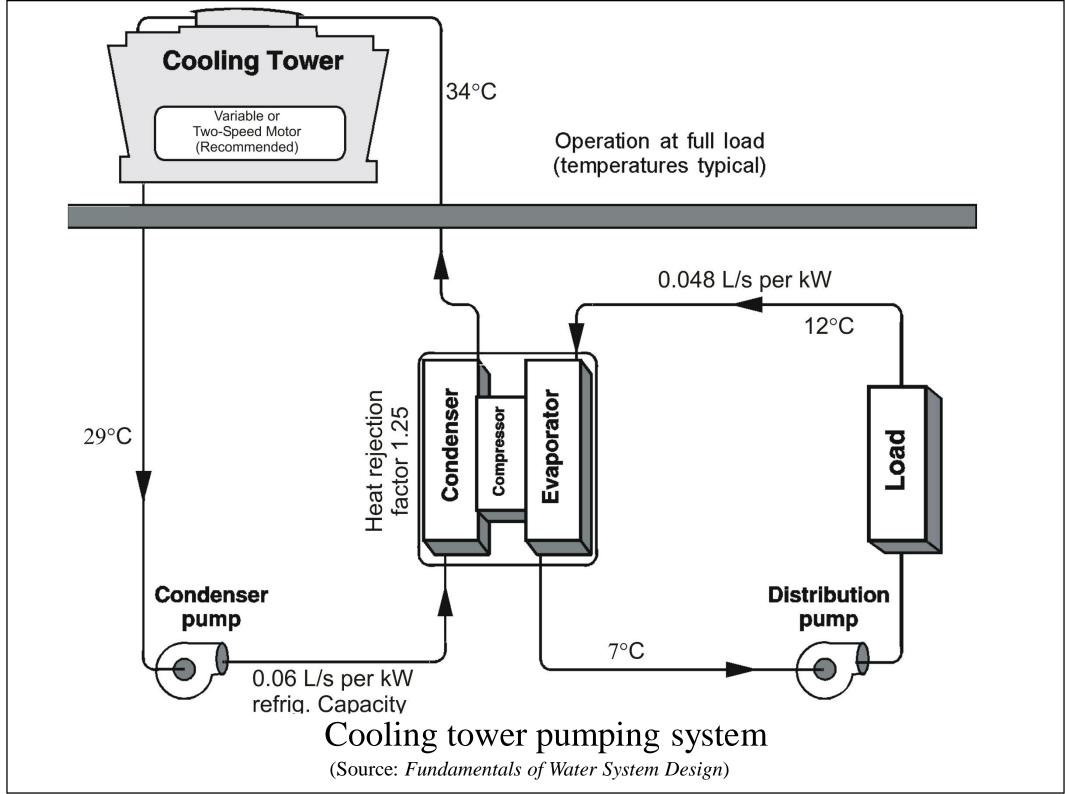

- Centrifugal pump
  - Most widely used in HVAC applications, e .g.
    - Hot water systems
    - Chilled water systems
    - Condenser water systems
    - Boiler feed and condensate return pumps

## Operation

- Electric motor's output torque => impeller's rotation
- Coupling to the pump shaft
- Centrifugal force & tip speed force

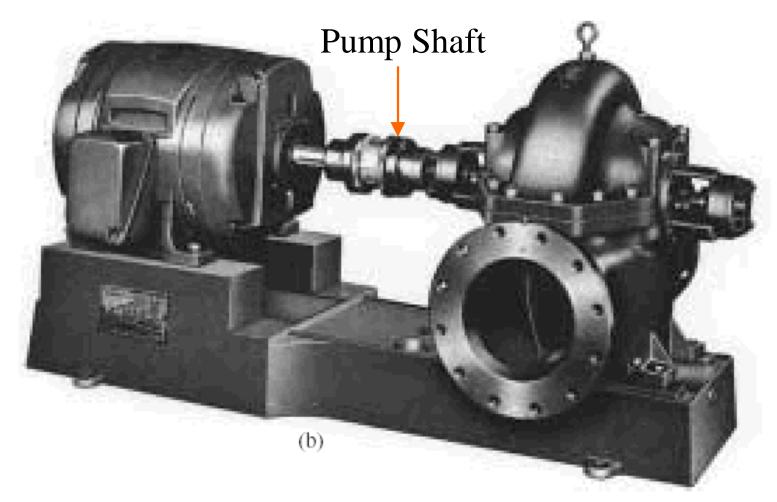

Chilled water pumping system

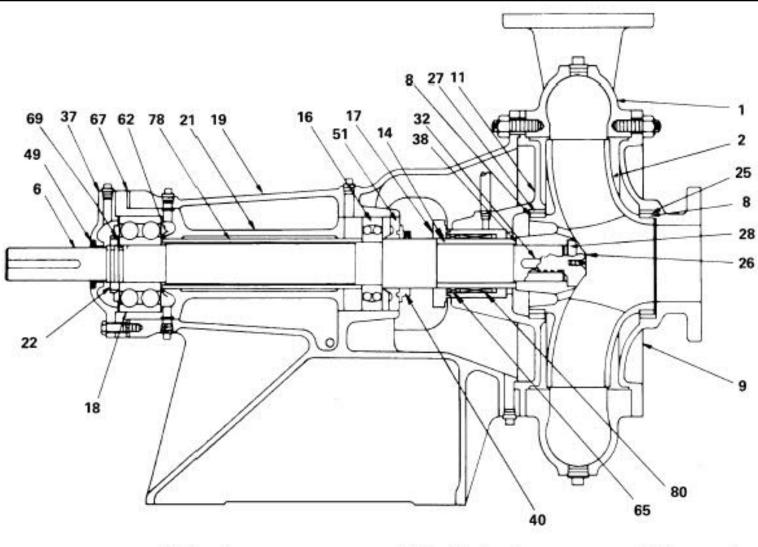

Pump motor

\* Video: Centrifugal Pump Working (5:54) <u>https://www.youtube.com/watch?v=IiE8skW8btE</u> http://www.learnengineering.org/2013/03/centrifugal-pump.html

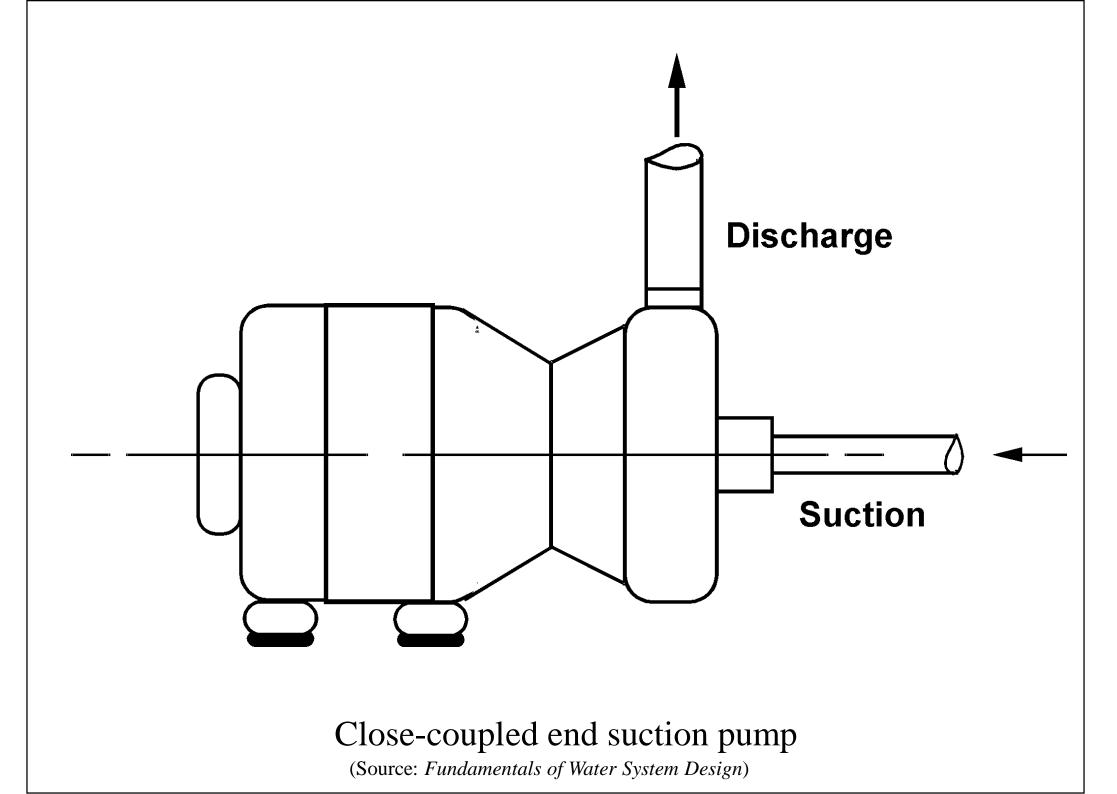

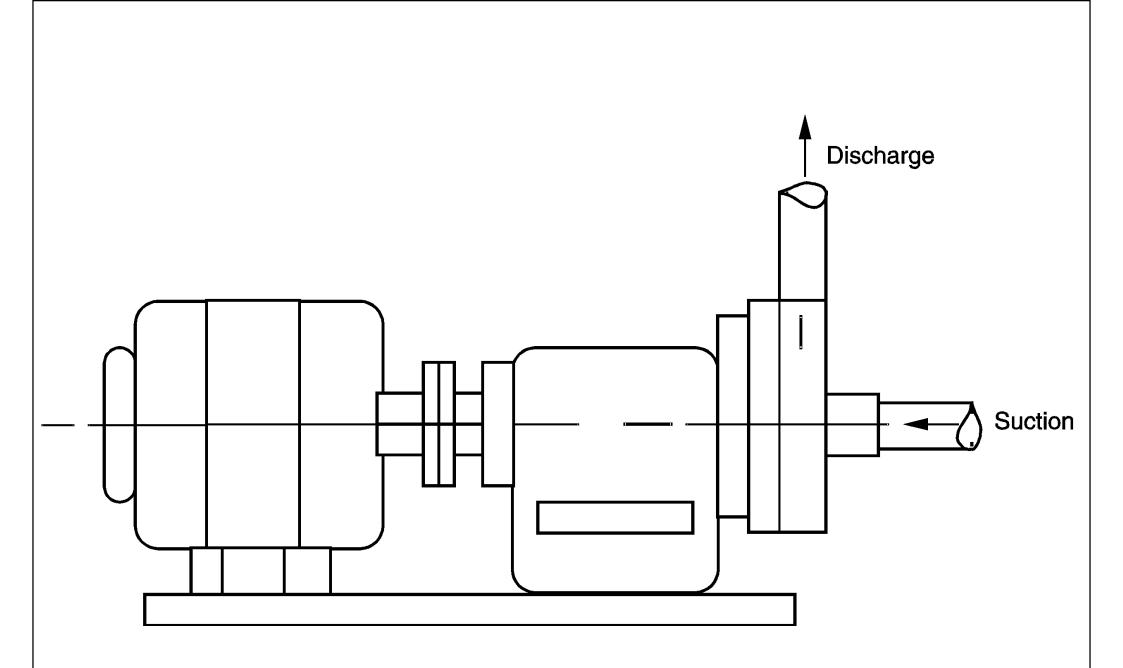

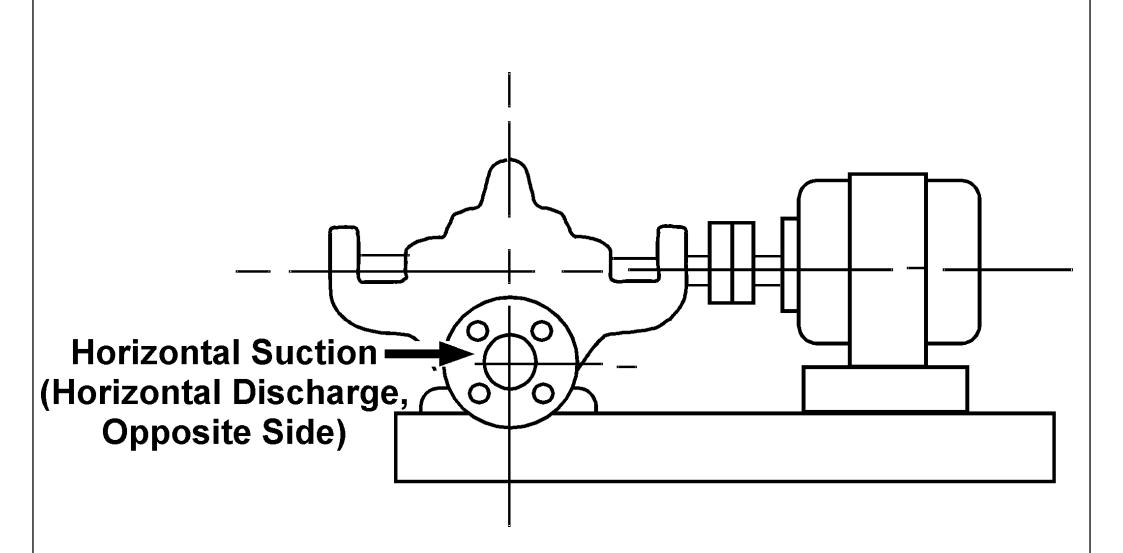

- Types of centrifugal pumps
  - Circulator pump
  - Closed-couple end suction pump
  - Frame-mounted end suction pump
  - Base-mounted horizontal split case pump
  - Vertical inline pump
  - Vertical turbine single or multistage pump

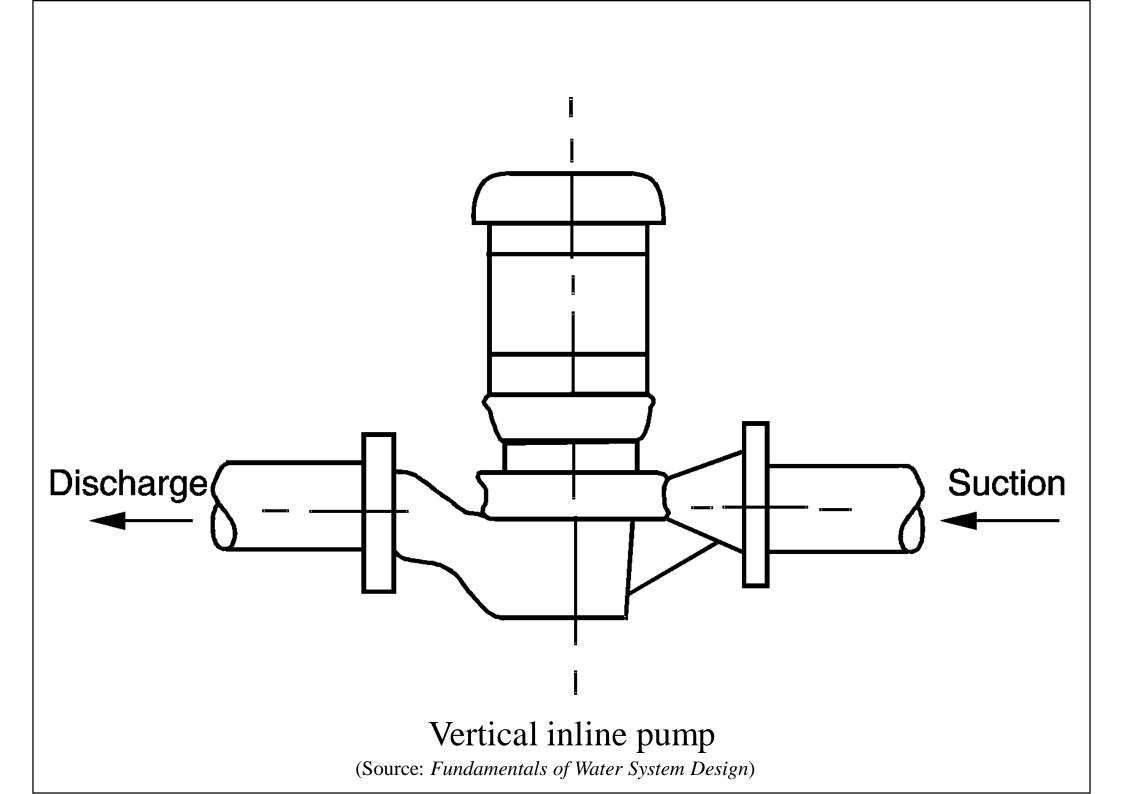

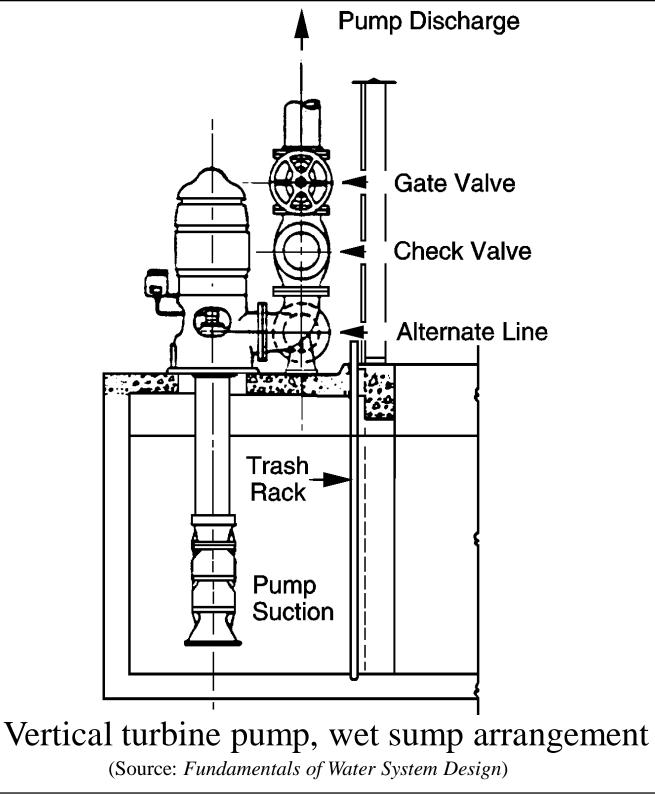

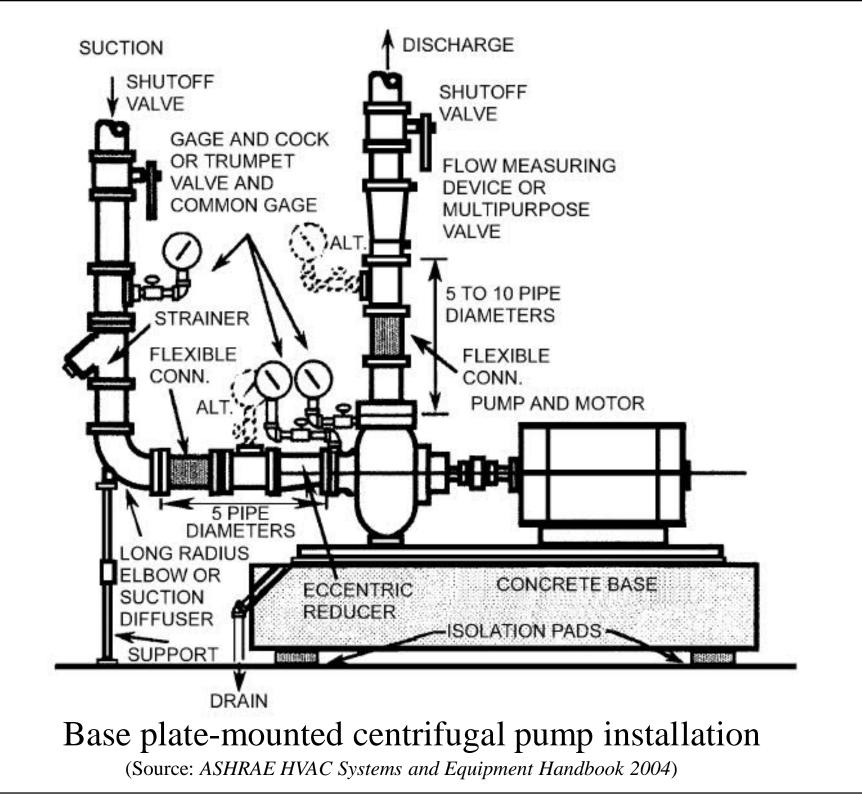

Frame-mounted end suction pump

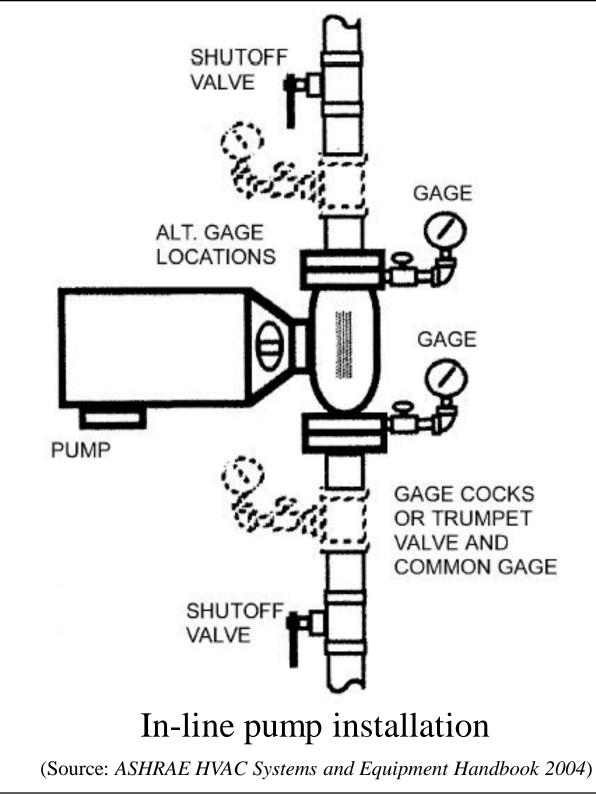

#### Base-mounted horizontal split case pump

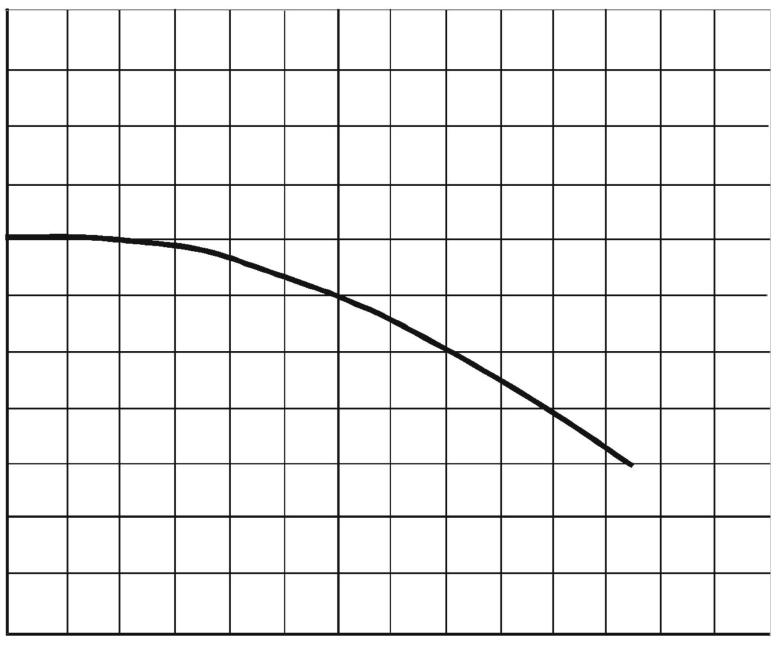

- Variable speed pumps
  - Less expensive nowadays
- Centrifugal pump characteristics\*
  - Total pressure-capacity curve
    - Flat curve: applied on closed piping systems with modulating valves
    - Steep curve: usually for open piping systems (cooling towers), w/ high pressure, constant flow
  - Family of pump performance curves

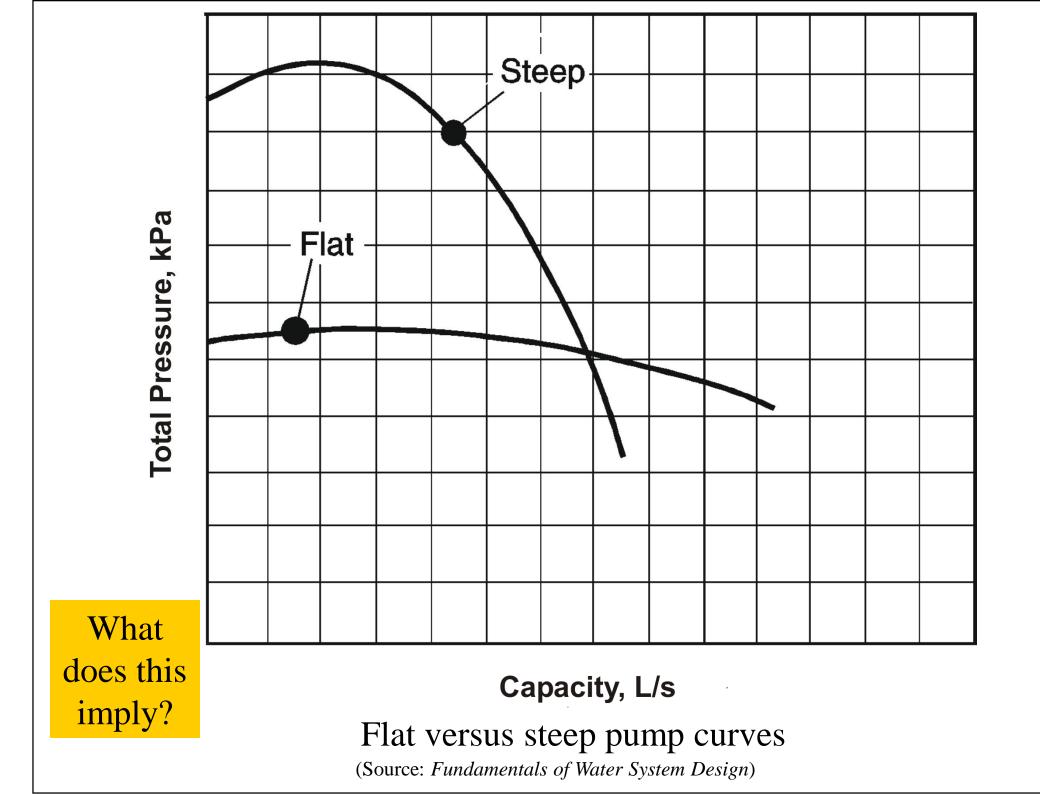

\* Video: Centrifugal Pumps | Design Aspects (5:32) <u>https://www.youtube.com/watch?v=pWSyrxFJmt4</u> <u>http://www.learnengineering.org/2013/03/centrifugal-pumps-design-aspects.html</u>

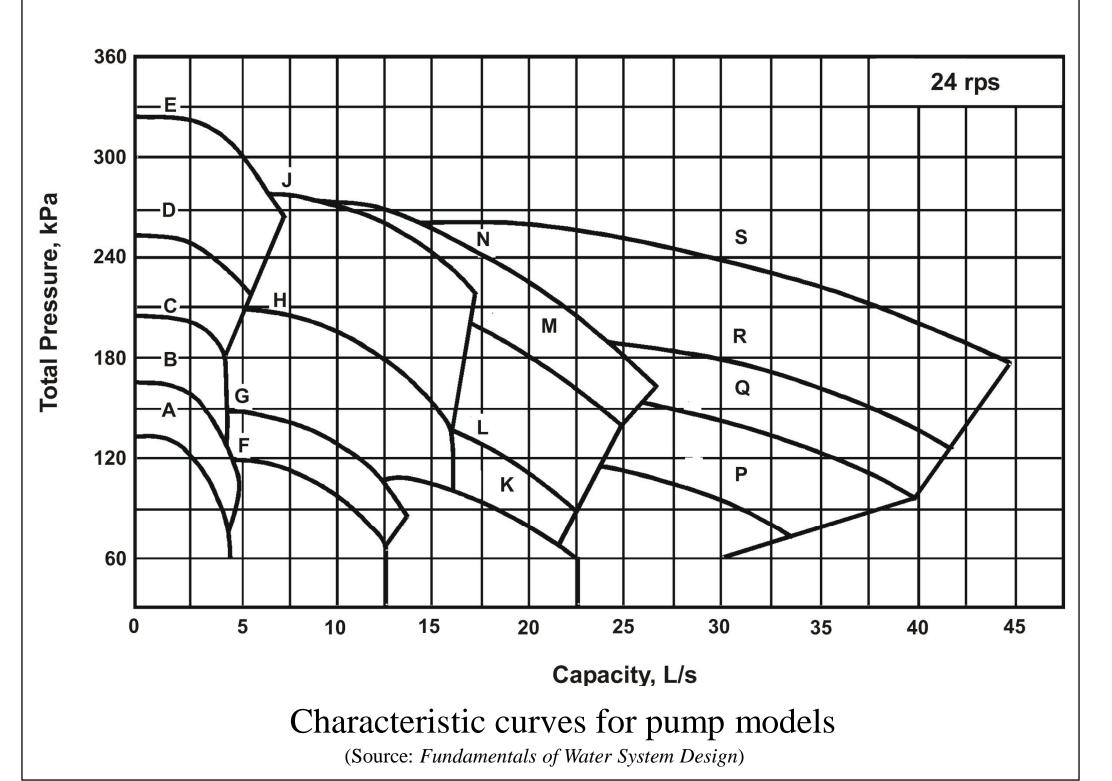

# Total Pressure, kPa

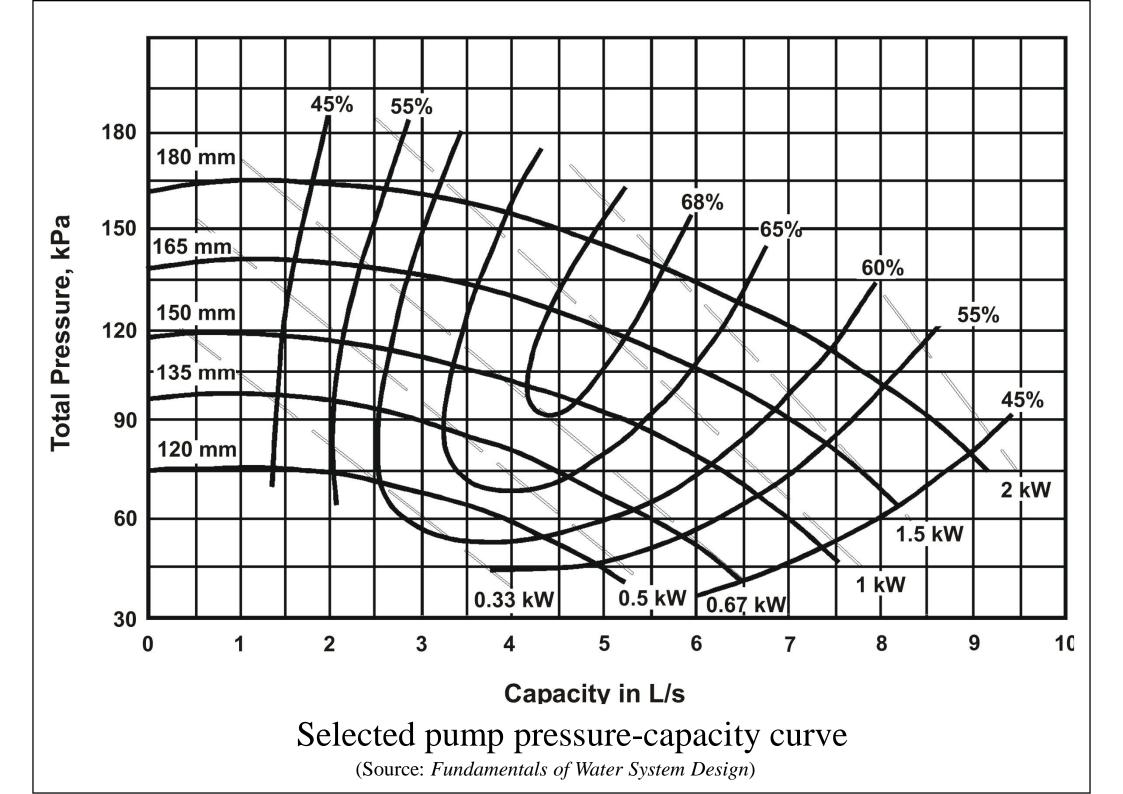

#### Capacity, L/s

## Total pressure-capacity curve

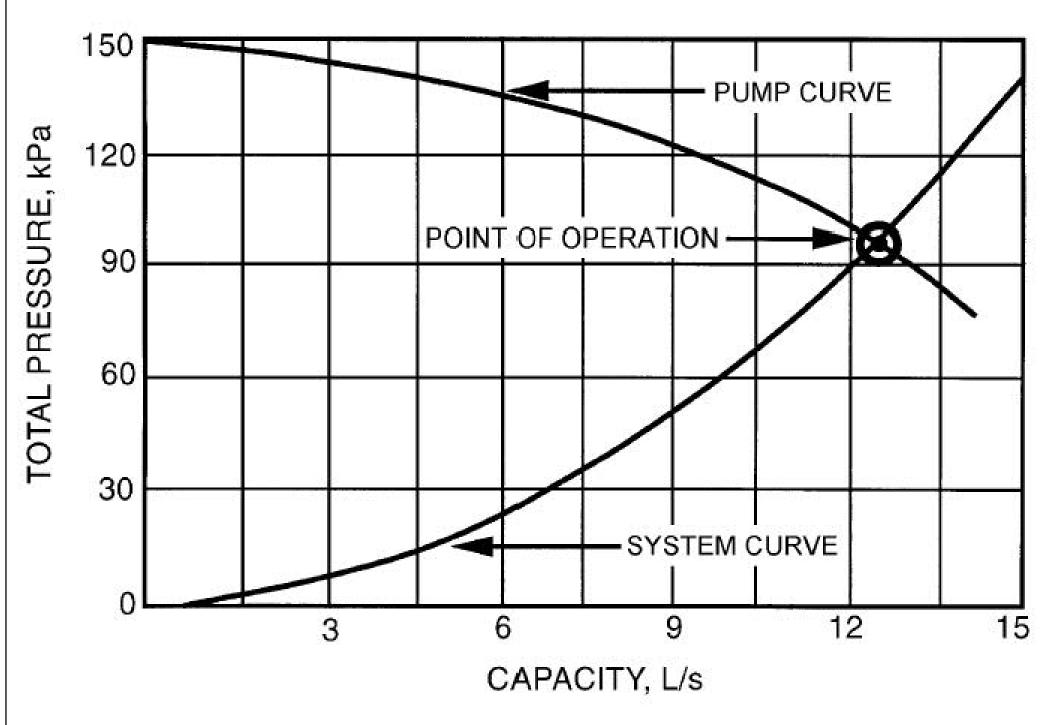

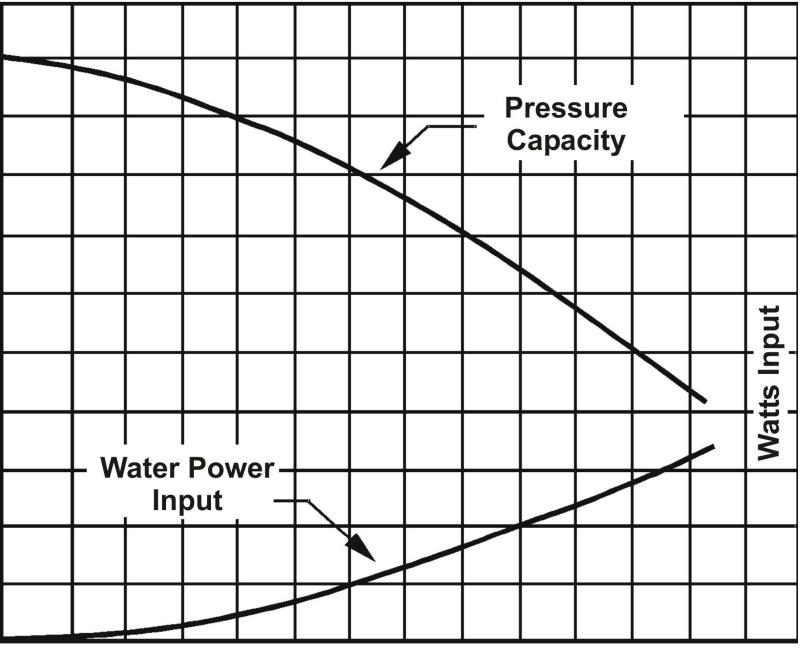

- System pressure characteristic curve
  - Compared w/: fan-duct system characteristics
  - System operating point: intersection of fan curve & system curve
- Pump power (W) = flow (L/s) x pressure (kPa)
  - Pump input power
  - Pump efficiency
    - Matching pump to system curve
    - Best efficiency point

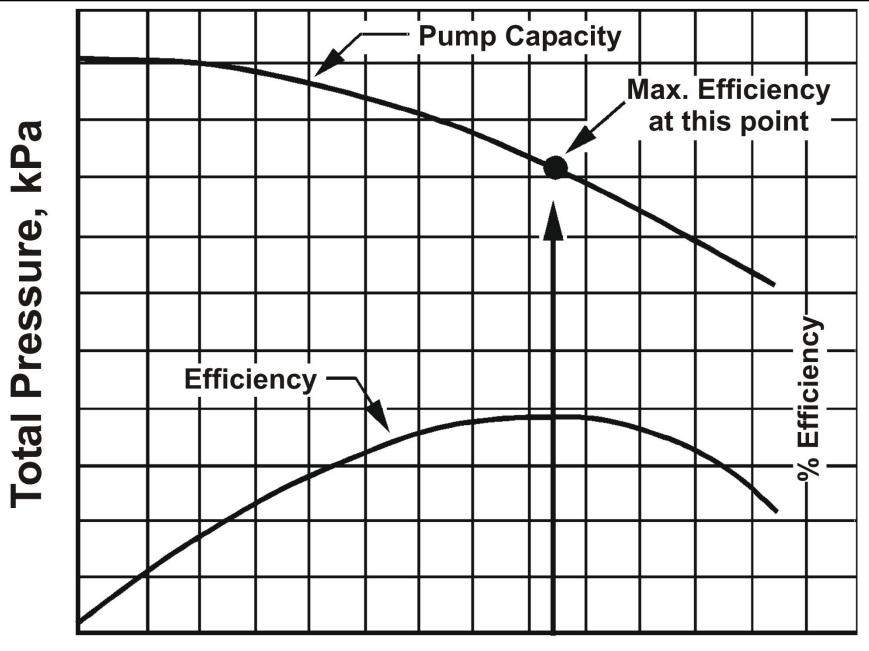

(Source: ASHRAE HVAC Systems and Equipment Handbook 2004)

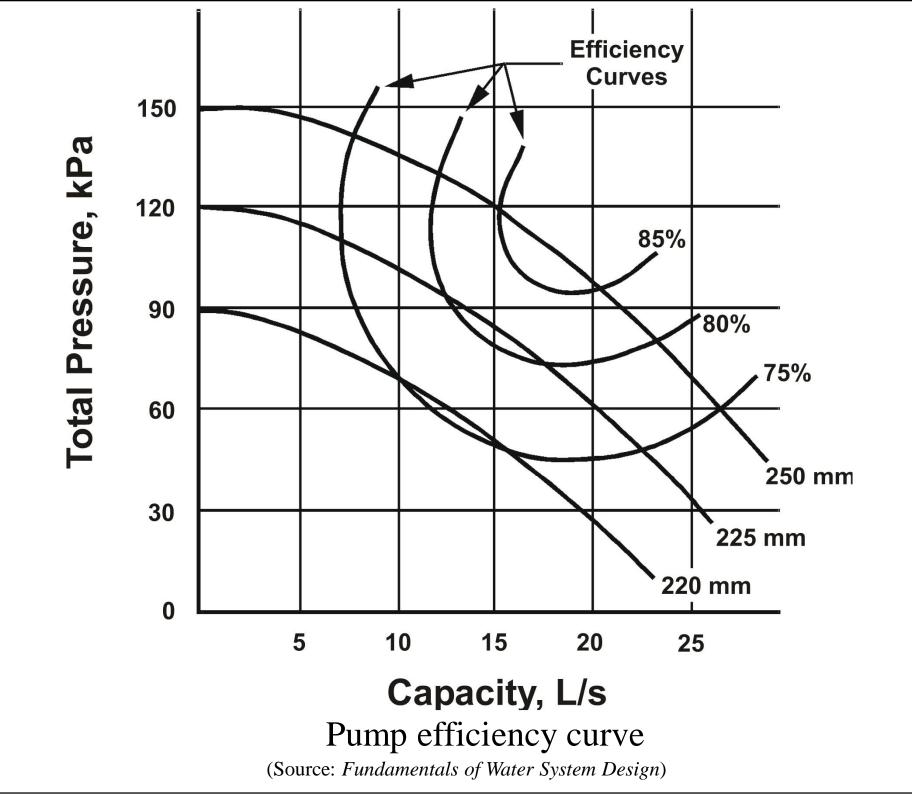

## Capacity, L/s

Increase of pumping power required with pump flow

## Capacity, L/s

#### Pump efficiency

- Similarity relationships
  - Pump affinity laws (c.f. fan laws)

Function	Speed change	Impeller diameter change
Flow	$Q_2 = Q_1 (N_2/N_1)$	$Q_2 = Q_1 (D_2/D_1)$
Pressure	$p_2 = p_1 (N_2/N_1)^2$	$p_2 = p_1 (D_2/D_1)^2$
Power	$P_2 = P_1 \ (N_2/N_1)^3$	$P_2 = P_1 \ (D_2/D_1)^3$

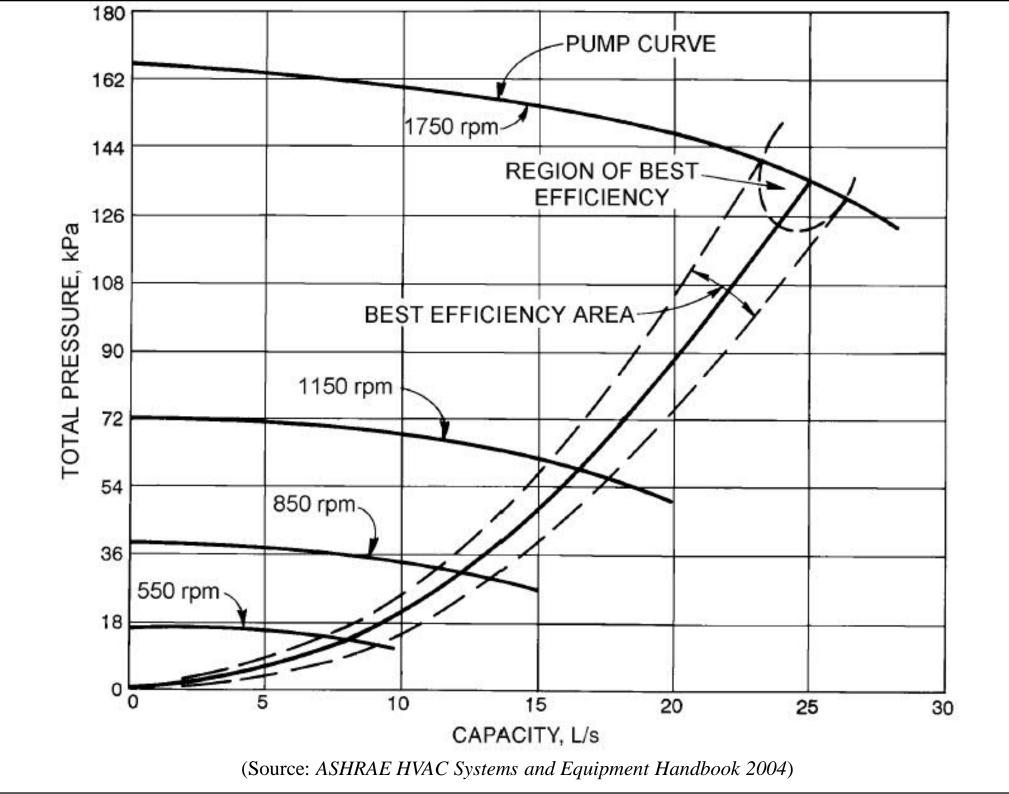

- Pump affinity laws (example)
  - A pump is rated at 15 L/s at 200 kPa with a 24 rpm electric motor. What is the flow and pressure if used with a 16 rps motor? Assume no system static pressure.

### • <u>Solution</u>:

• Flow:  $Q_2 = Q_1 (N_2/N_1) = 15 (16/24) = \underline{10 \text{ L/s}}$ 

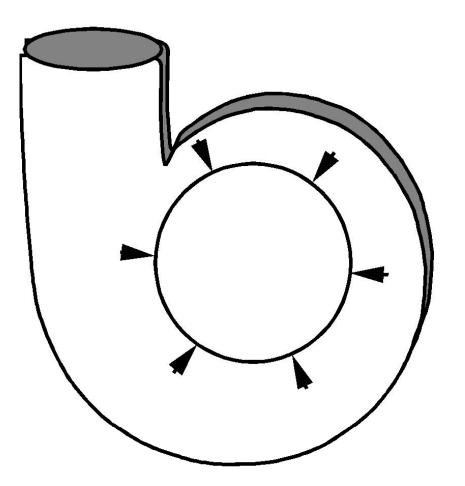

• Pressure:  $p_2 = p_1 (N_2/N_1)^2 = 200 (16/24)^2 = \underline{88.9 \text{ kPa}}$ 

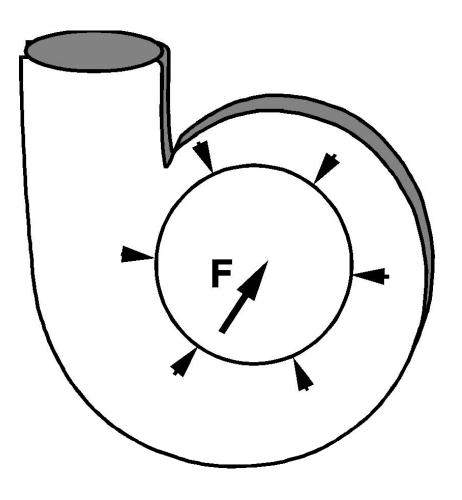

- Radial thrust
  - Non-uniform pressure around impeller
  - Greatest at shutoff
  - Decreases from shutoff to design capacity
  - Increase with overcapacity
- Net positive suction (NPS)
  - <u>Cavitation</u>: vapour pockets form in impeller passages & may cause damages\*
  - Net positive suction required (NPSR) pump

\* Video: Cavitation Causes and Effects (16:08) <u>https://www.youtube.com/watch?v=oRYYP4F8LTU</u>

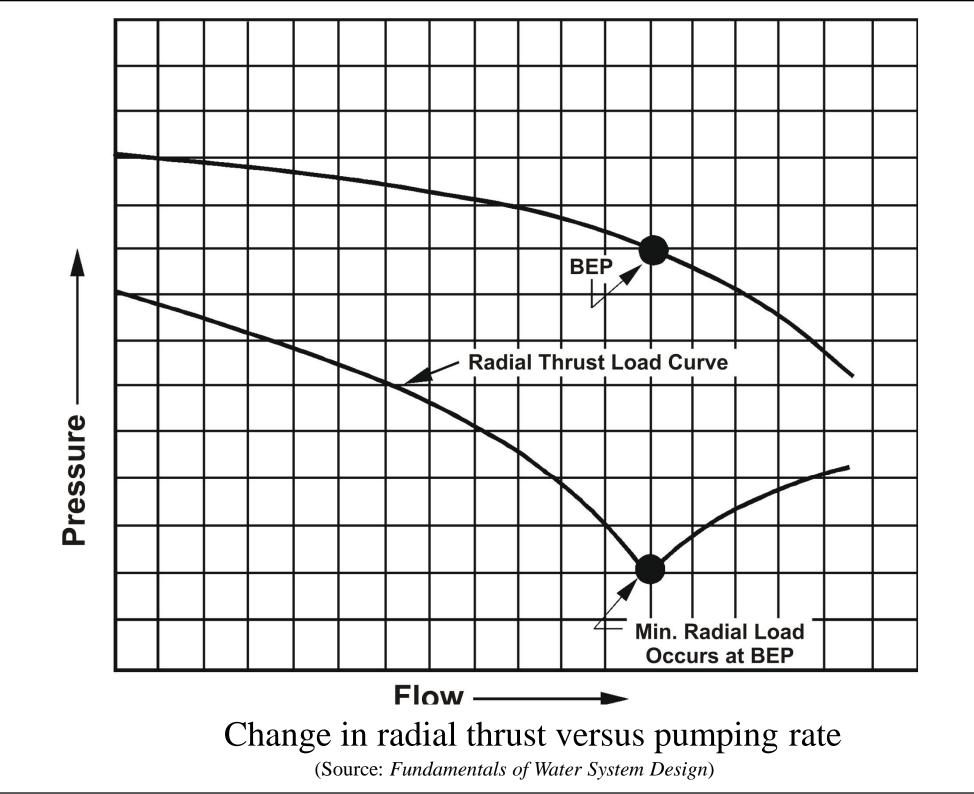

#### Uniform Pressures Exist at Design Capacity

Non-Uniform Pressures Exist at Reduced Capacities

Pressures on impeller causing radial thrust

## **Centrifugal Pumps**

- Net positive suction available (NPSA)
  - For the installation
  - Total useful energy above the vapour pressure at the pump suction connection
  - Affected by the location of expansion tank
- If NPSA < Pump's NPSR
  - Cavitation, noise, inadequate pumping, etc.
  - Avoid problem, NPSA > NPSR

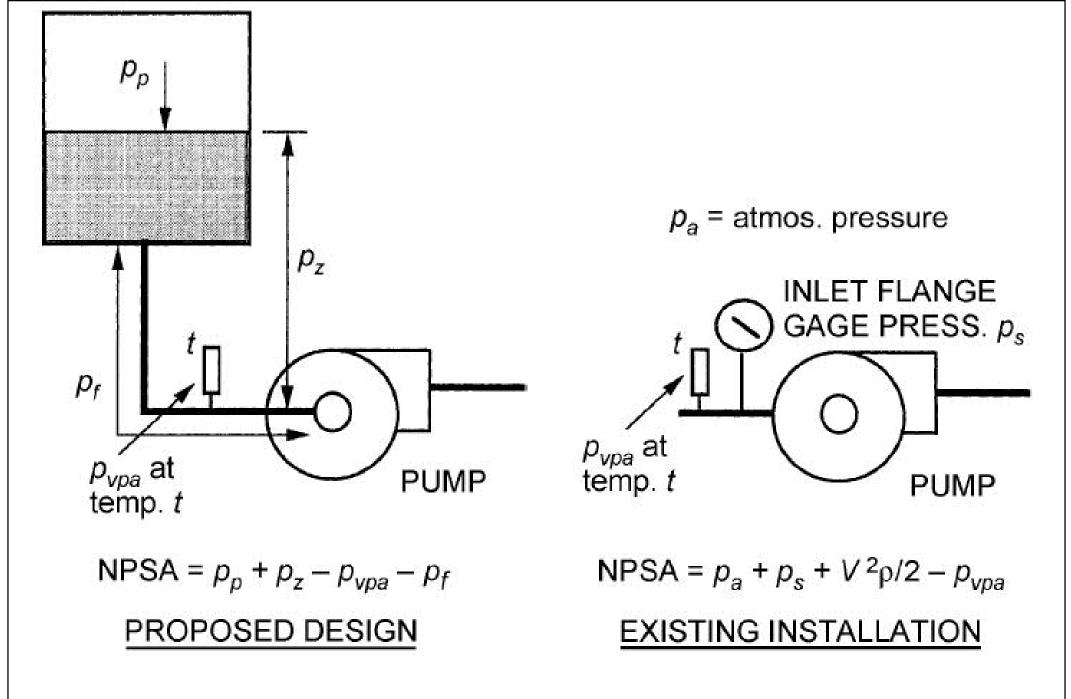

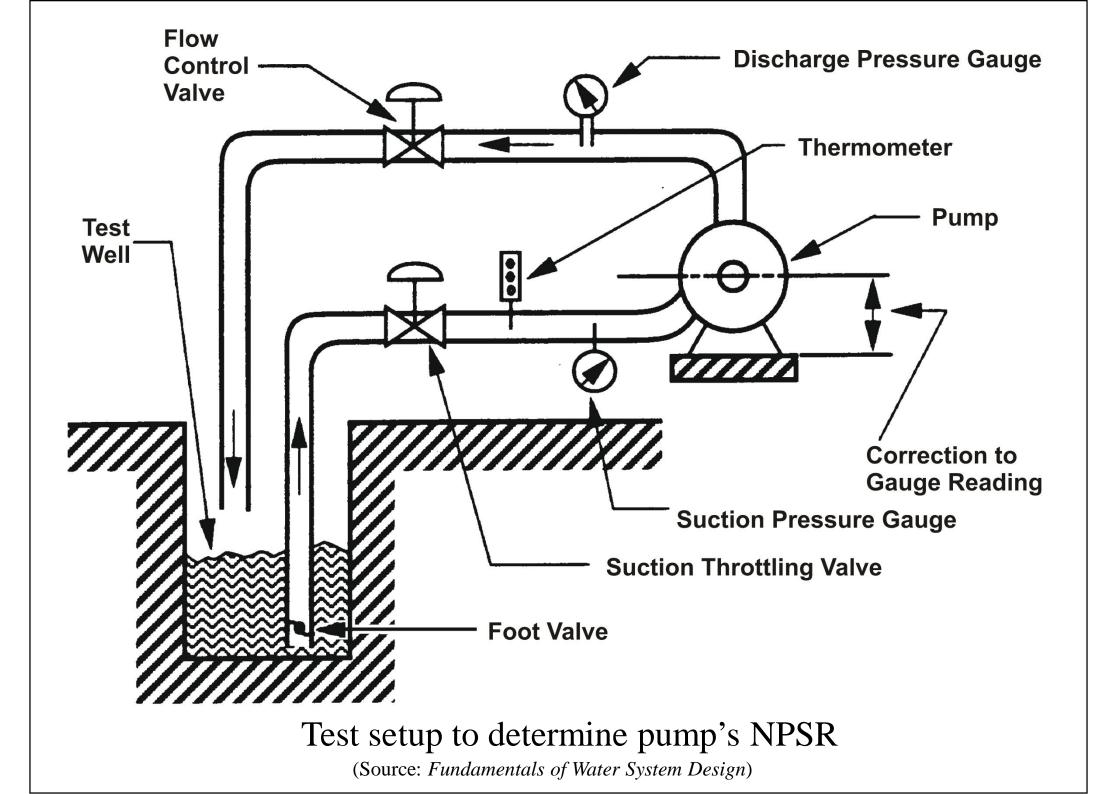

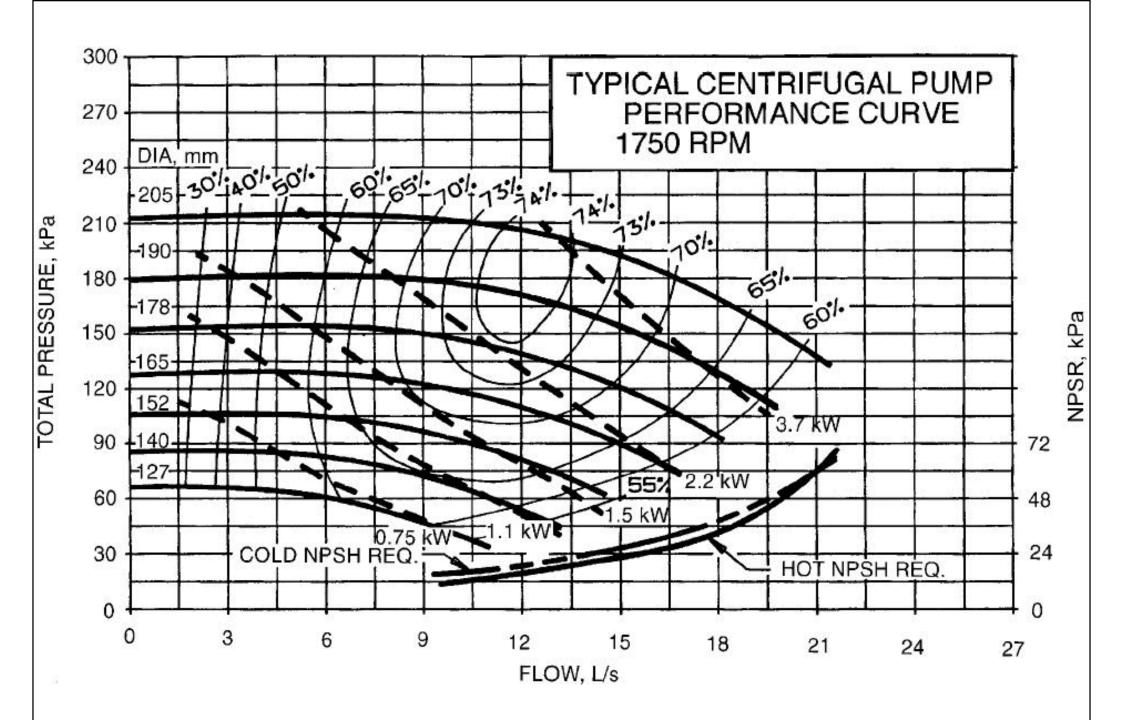

Fig. 29 Net Positive Suction Pressure Available

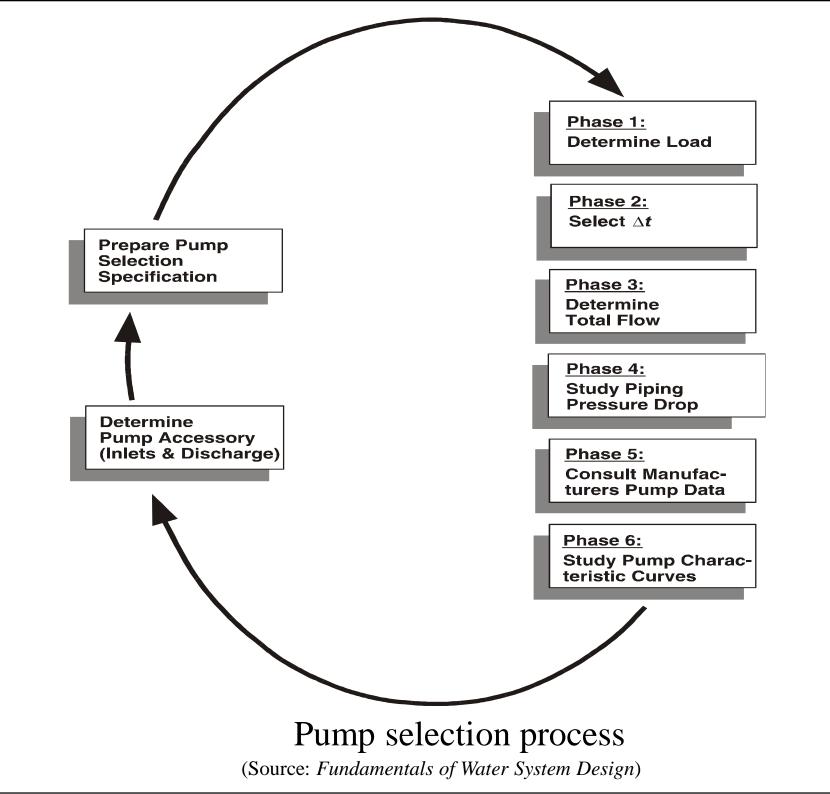

(Source: ASHRAE HVAC Systems and Equipment Handbook 2004)

## **Pump Arrangements**

- Pump design criteria
  - Design flow & minimum system flow
  - Pressure drop required for the most resistant loop
  - System pressure at maximum and minimum flows
  - Type of control valve—two-way or three-way
  - Continuous or variable flow
  - Pump environment, number of pumps and standby
  - Electric voltage and current
  - Electric service and starting limitations
  - Motor quality versus service life
  - Water treatment, water conditions, and material selection

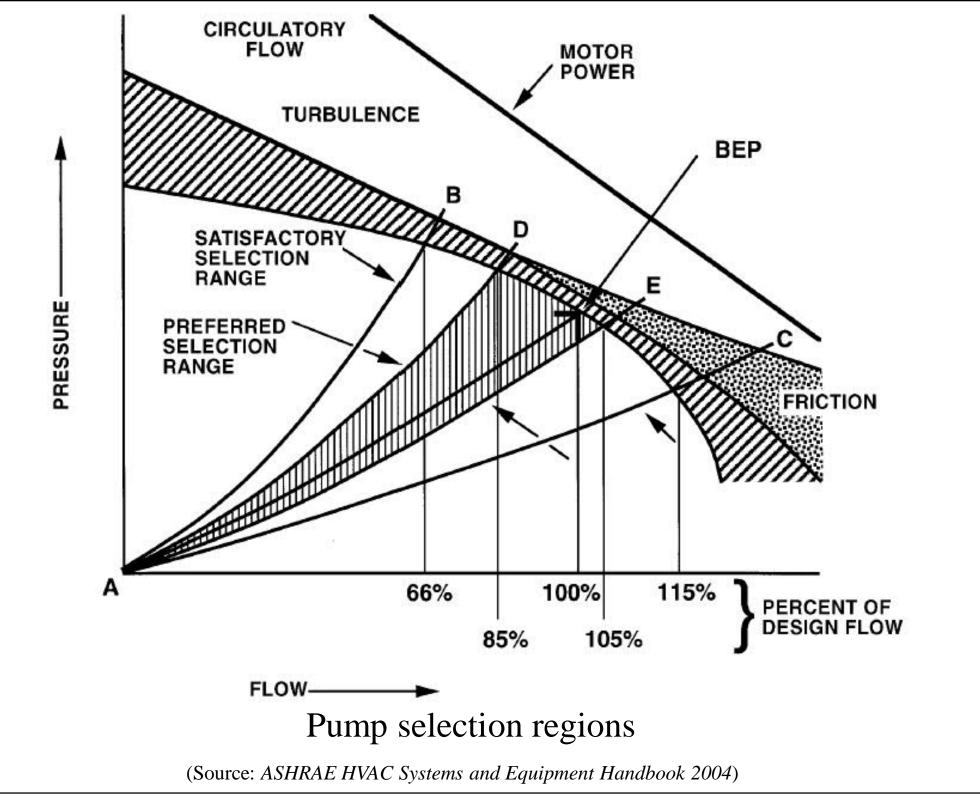

## **Pump Arrangements**

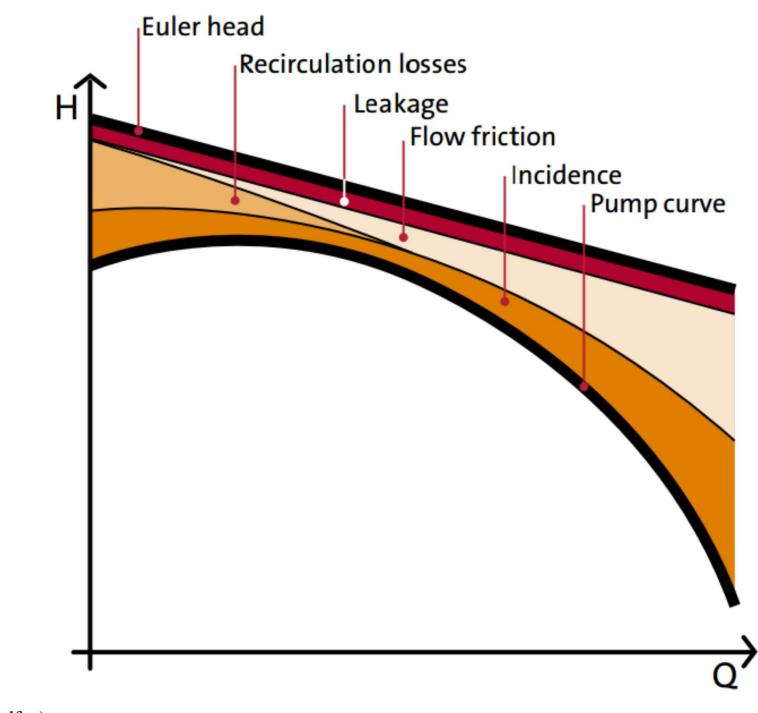

- Pump selection process
  - Determine the load to be pumped
  - Determine design  $\Delta t$  & calculate required flow
  - Sum up the load flows to determine total flow
  - Determine the "critical path" (most resistant)
  - Determine mounting method & support
  - Select a pump from manufacturer
    - Flat curve & steep curve, pump operation & motor
    - Check overflow capacity when staging multiple pumps

#### Reduction of theoretical Euler head due to losses

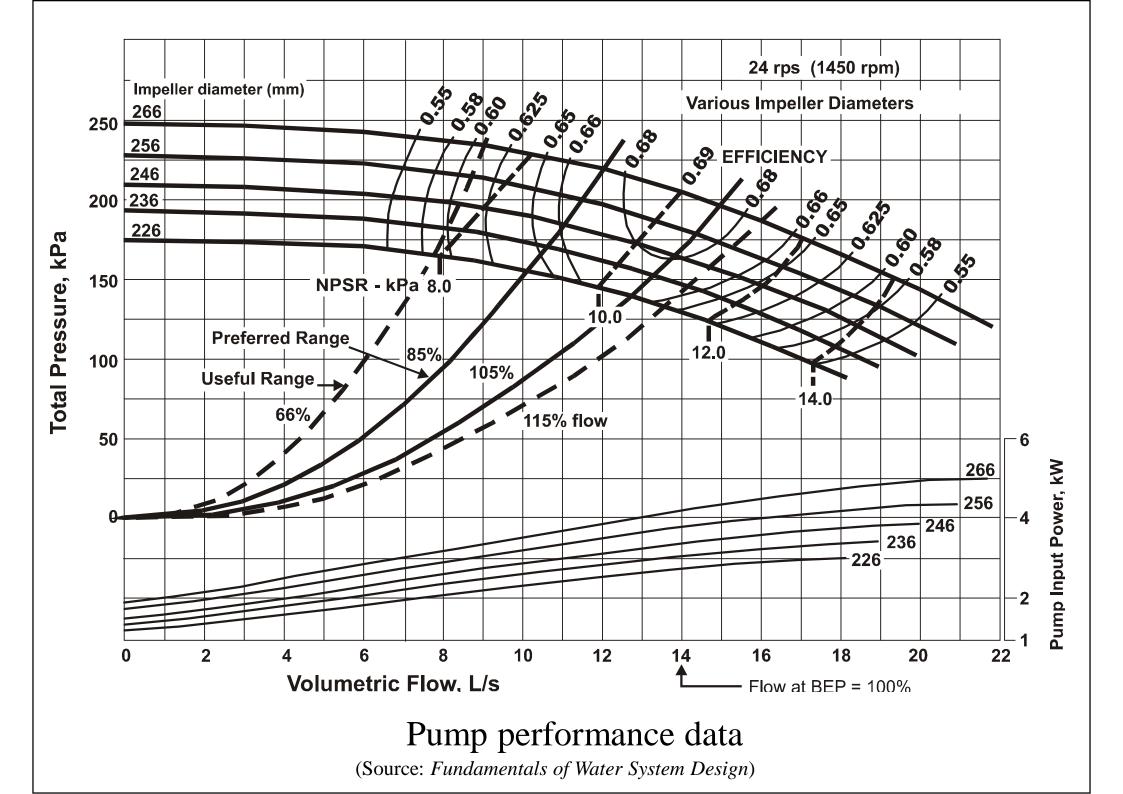

(Source: Grundfos)

Increase in power consumption due to losses

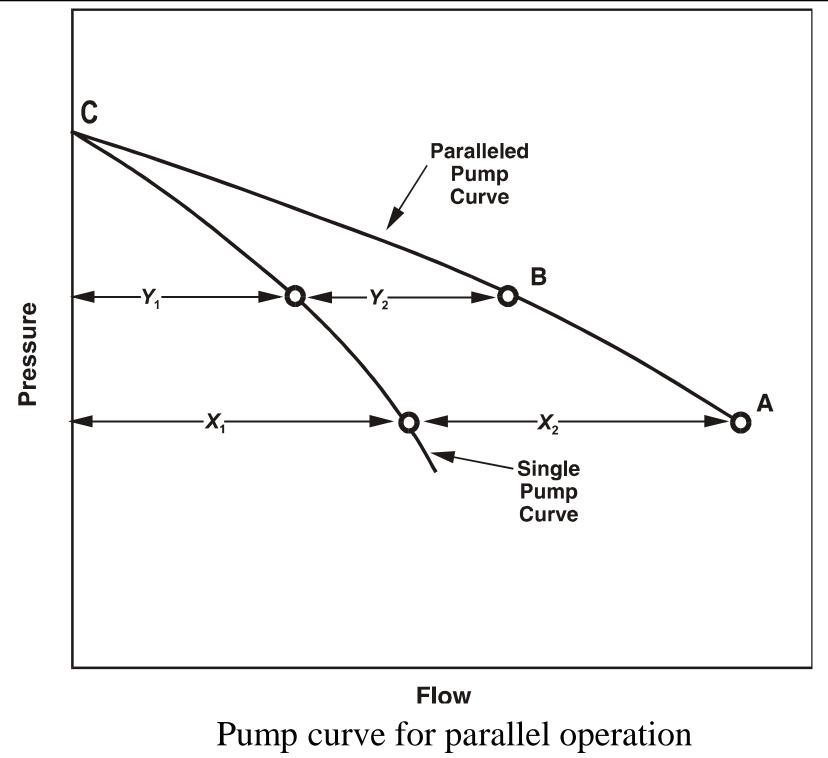

(Source: Grundfos)

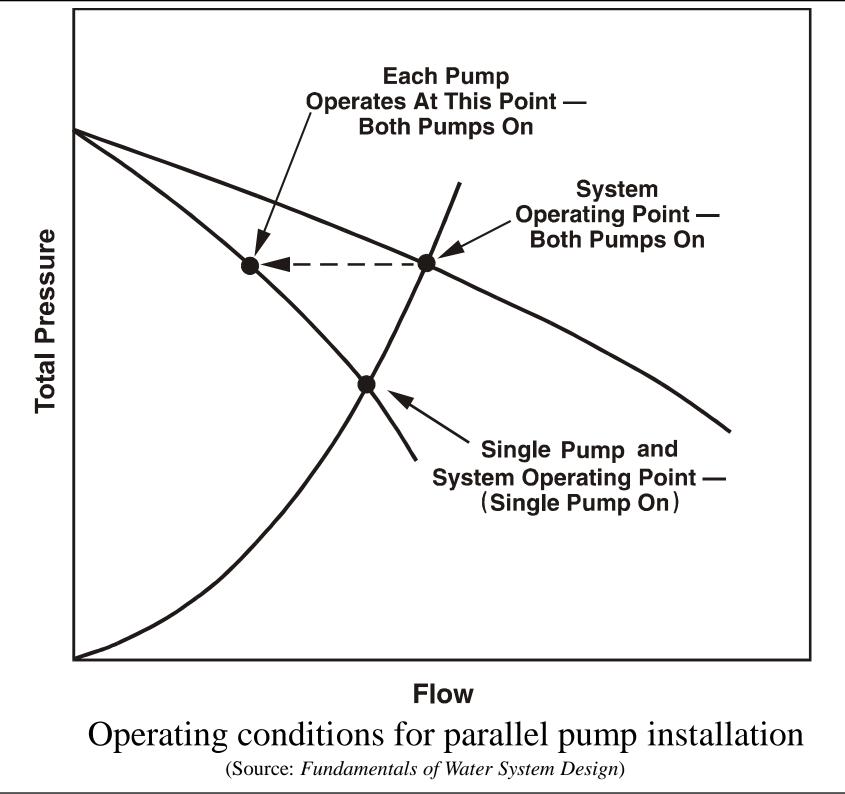

## **Pump Arrangements**

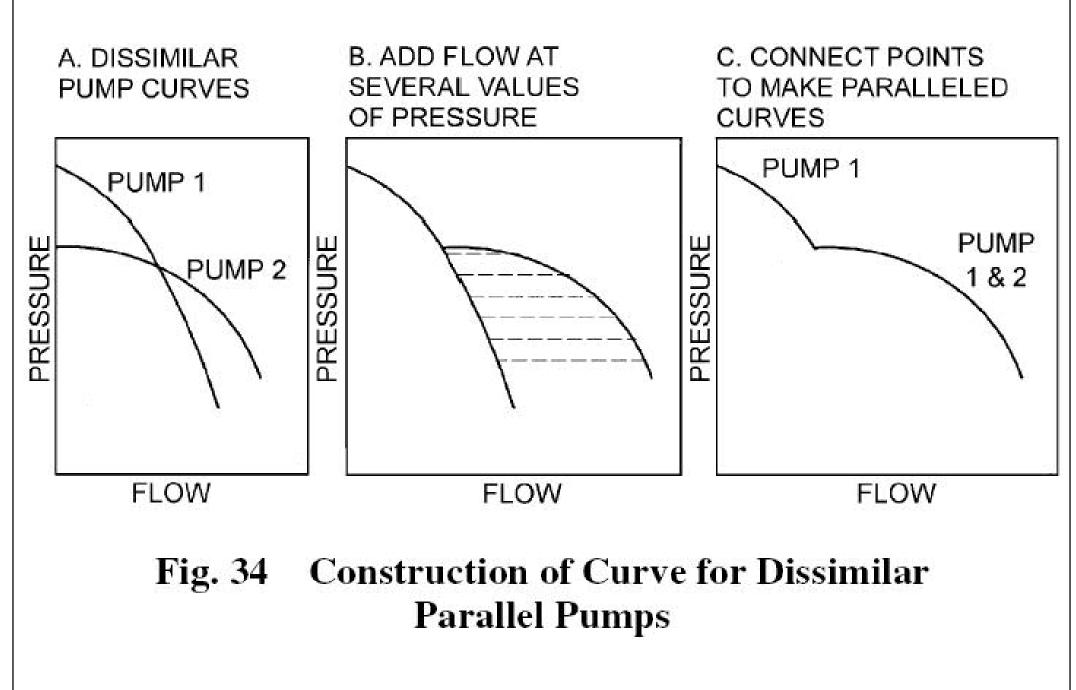

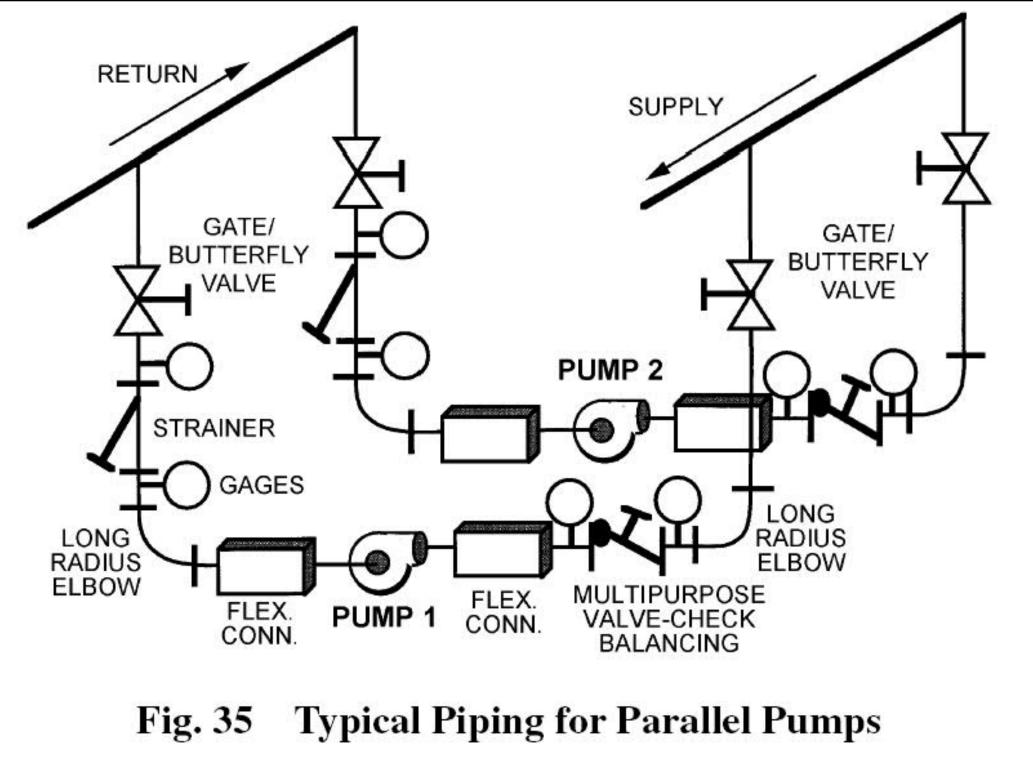

- Pumping arrangements & control scenarios
  - Multiple pumps in parallel or series
  - Standby pump
  - Pumps with two-speed motors
  - Primary-secondary pumping
  - Variable-speed pumping
  - Distributed pumping

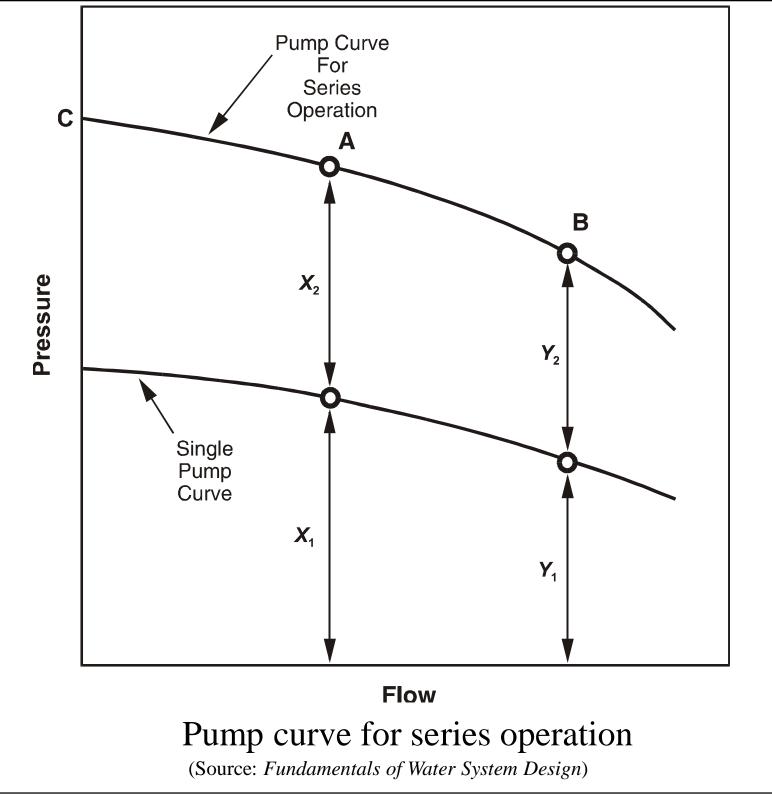

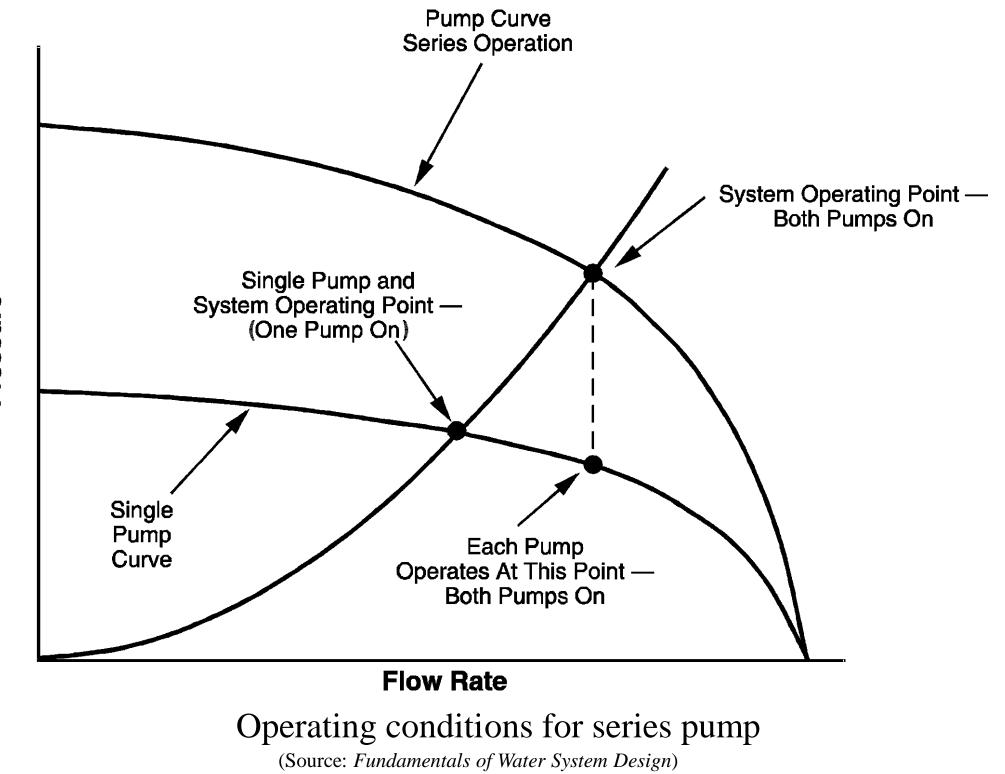

(Source: Fundamentals of Water System Design)

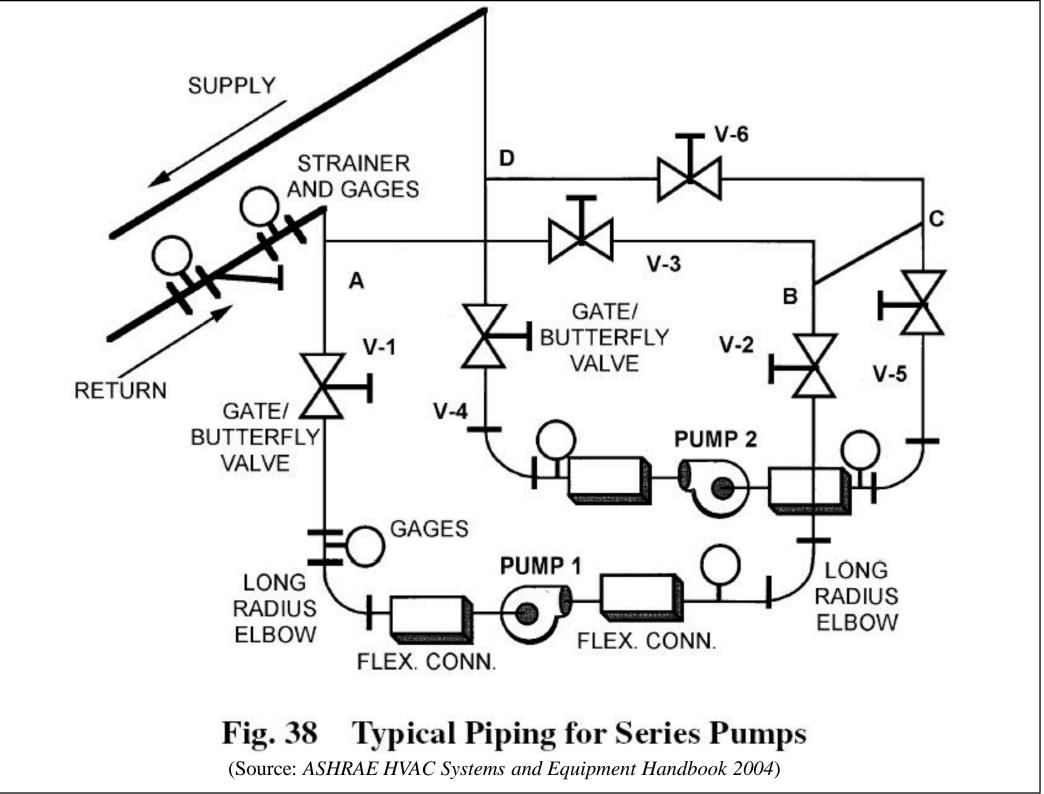

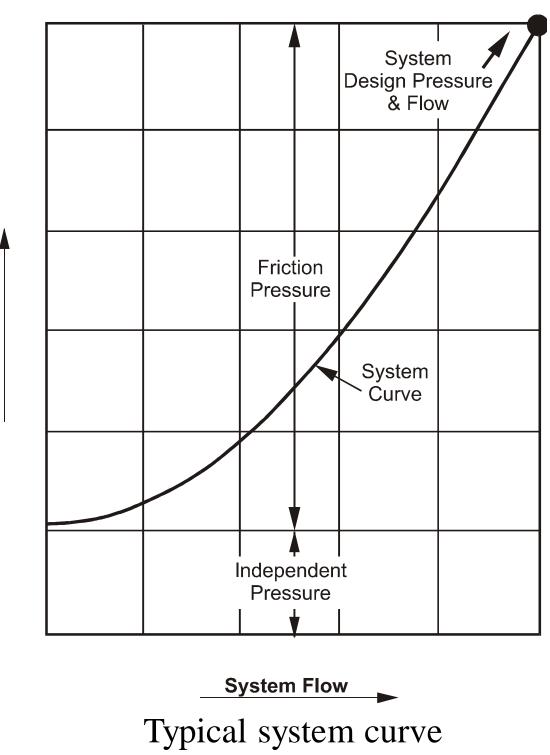

Pressure

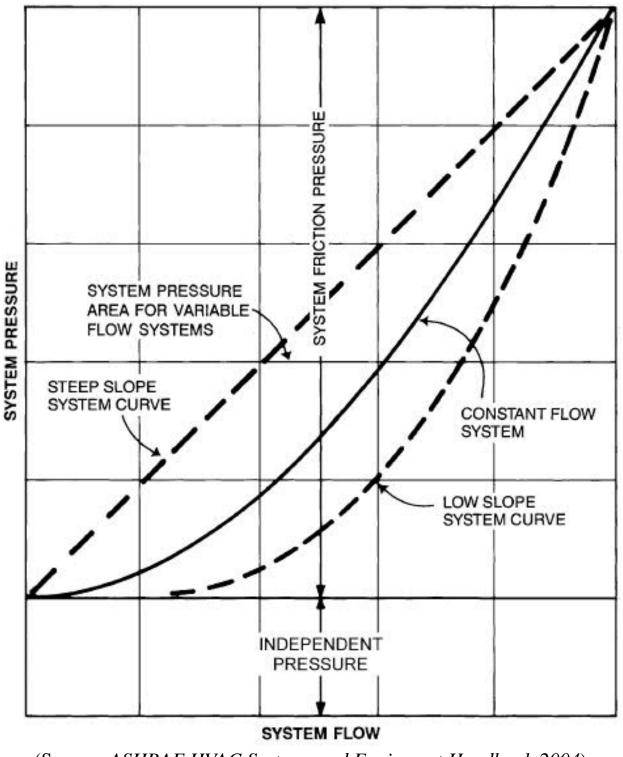

# **Matching Pumps to Systems**

- Good piping system design
  - Match system characteristics to pump curve
- Trimming pump impellers
  - To reduce flow
  - To match partload requirments
- Pump control
  - Two-speed pumping & motors
  - Variable speed pumping

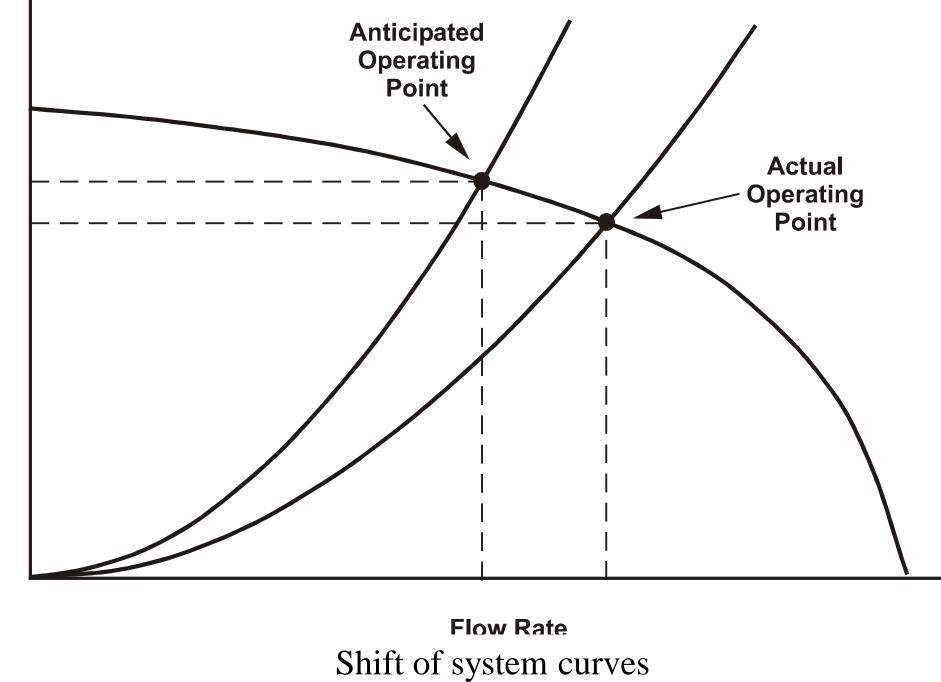

**Total System Pressure**

(Source: Fundamentals of Water System Design)

# **Total Pressure**

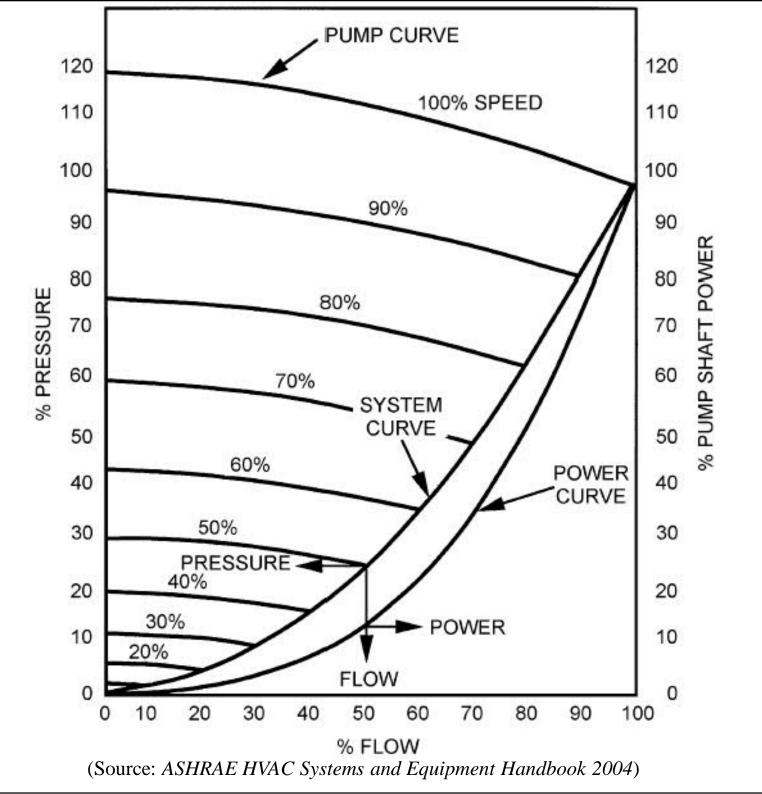

#### Fig. 39 Example of Two Parallel Pumps with Two-Speed Motors

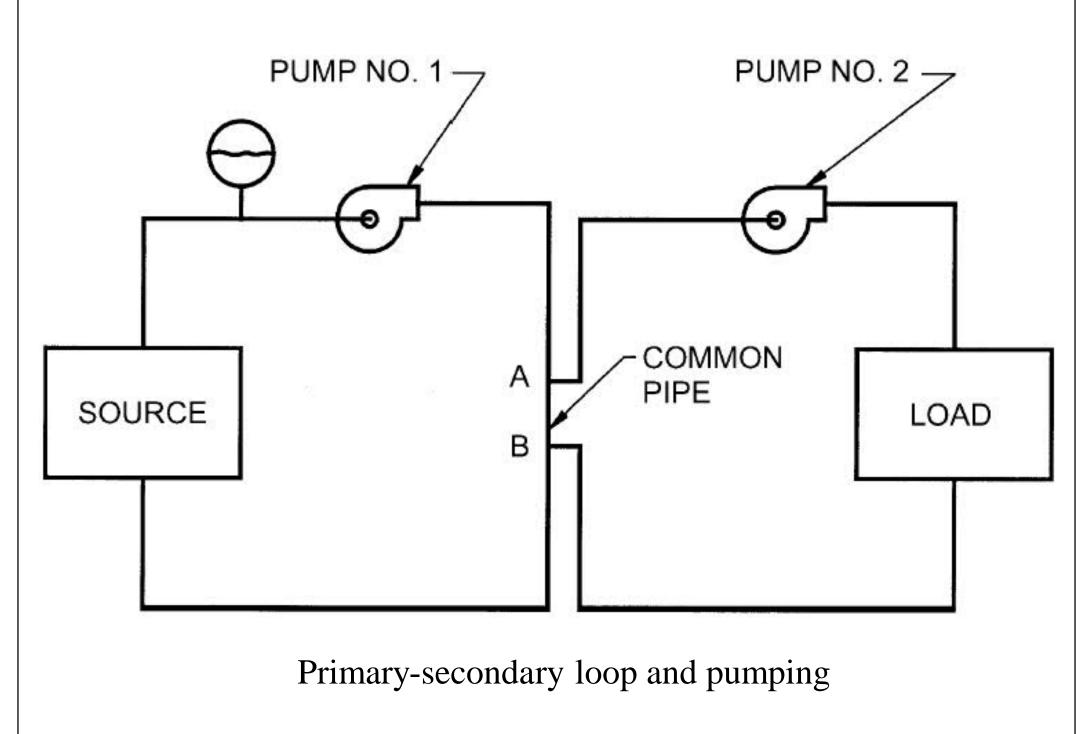

# **Matching Pumps to Systems**

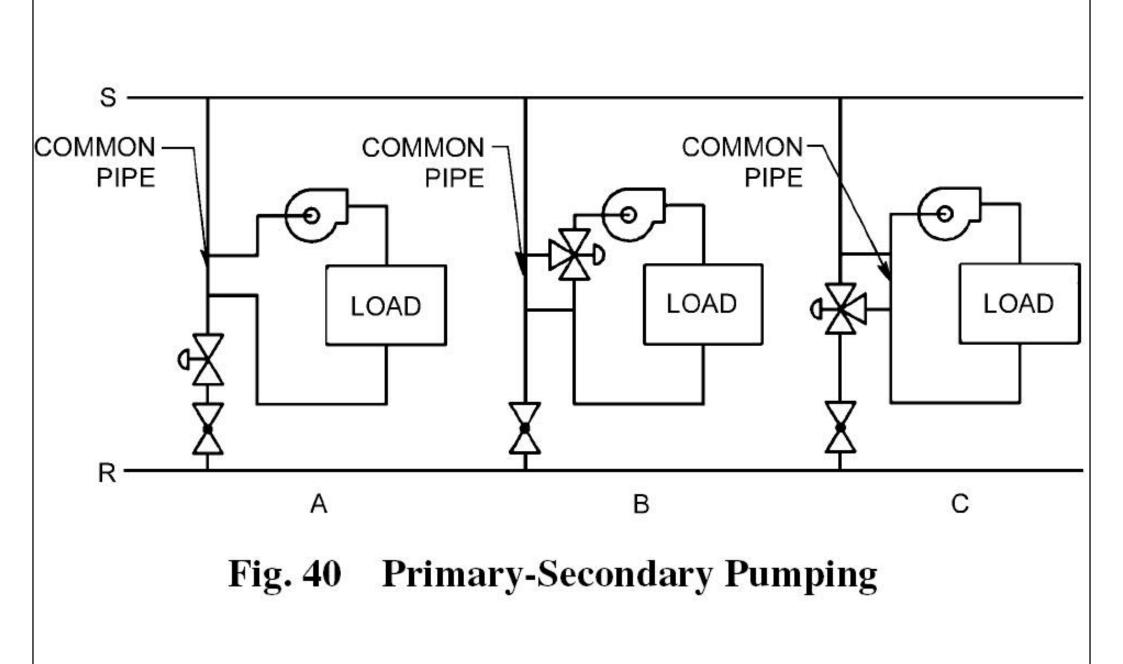

- Modulation of pump-piping systems
  - Throttle volume flow by using a valve
    - Change flow resistance new system curve
    - Also known as "riding on the curve"
  - Turn water pumps on or off in sequence
    - Sudden increase/drop in flow rate and head
  - Vary the pump speed
    - System operating point move along the system curve
    - Requires the lowest pump power input

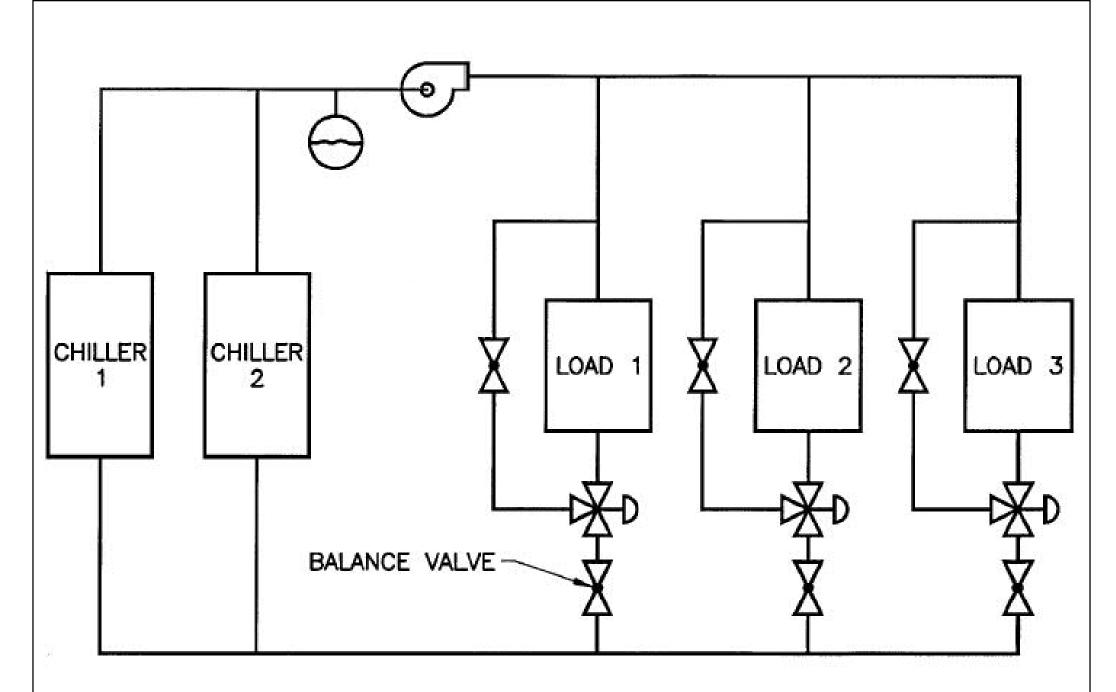

# **Matching Pumps to Systems**

- Plant loop (at constant flow) (production loop)
  - To protect evaporator from freezing, a fairly constant-volume water flow is required
- Building loop (at variable flow)
  - For saving energy at partload
  - A differential pressure transmitter is often installed at the farthest end from the pump
- Primary-secondary loop
  - A short common pipe connects the 2 loops

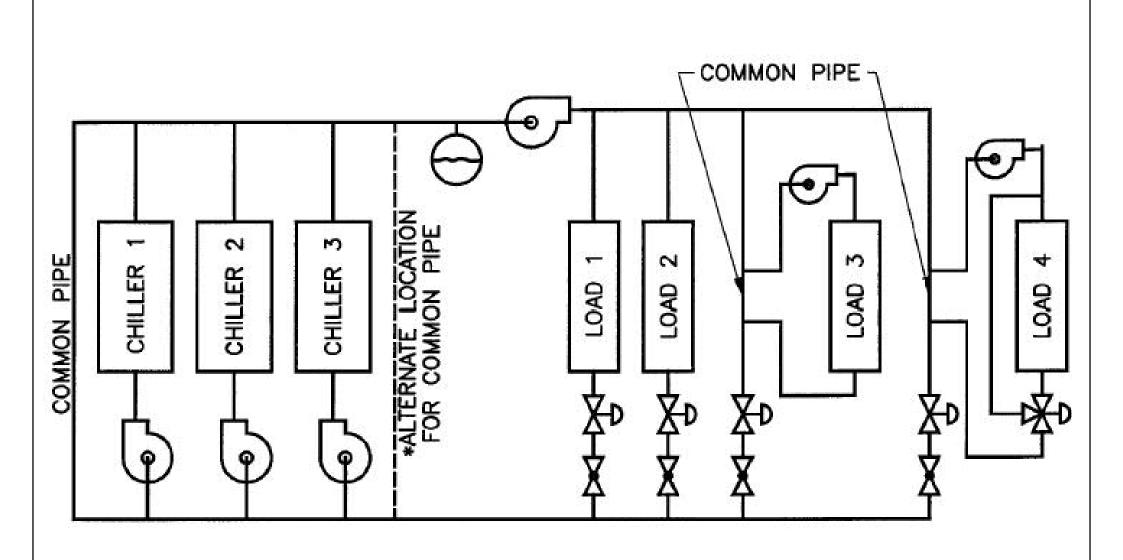

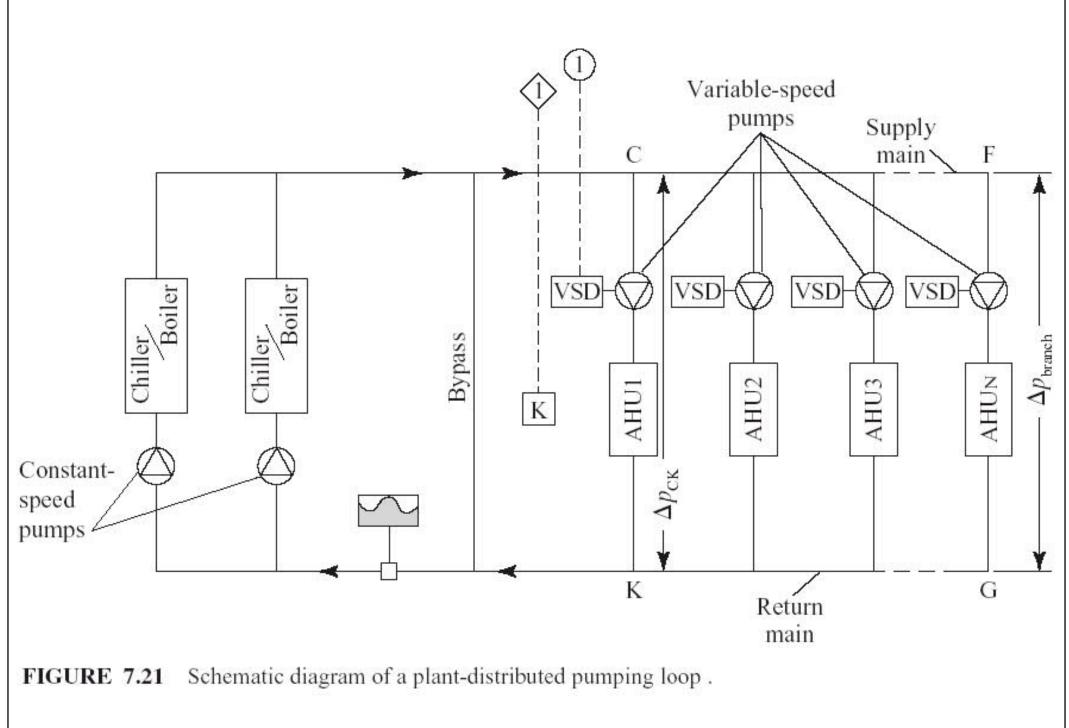

(Source: ASHRAE HVAC Systems and Equipment Handbook 2004)

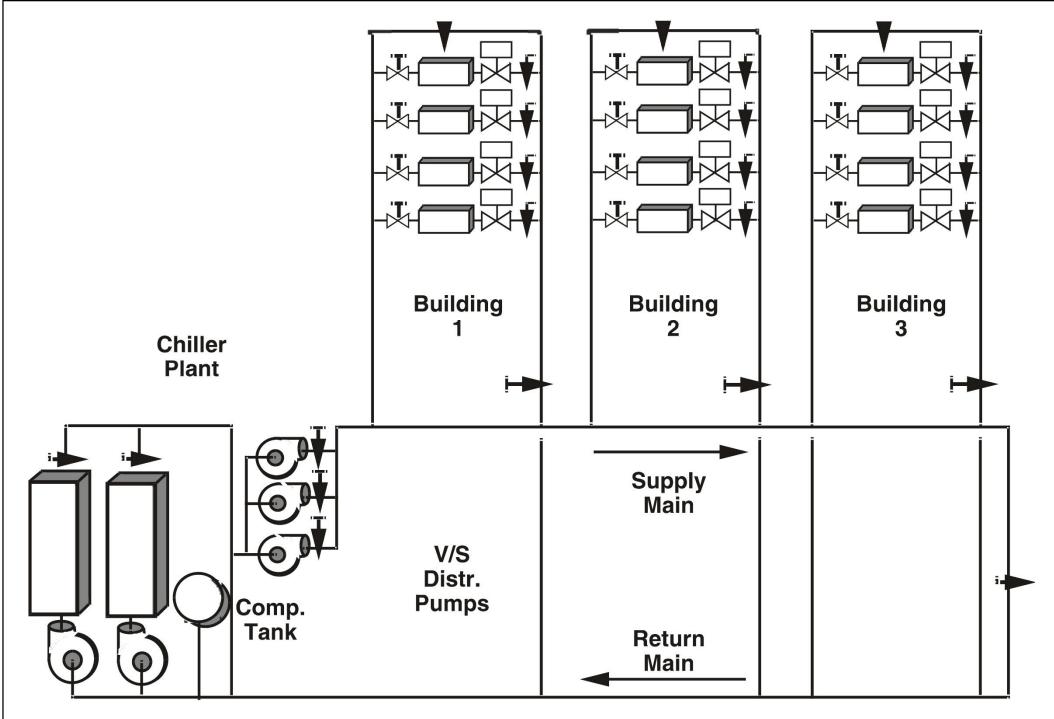

Constant flow chilled water system

#### Variable flow chilled water system (plant-building loop)

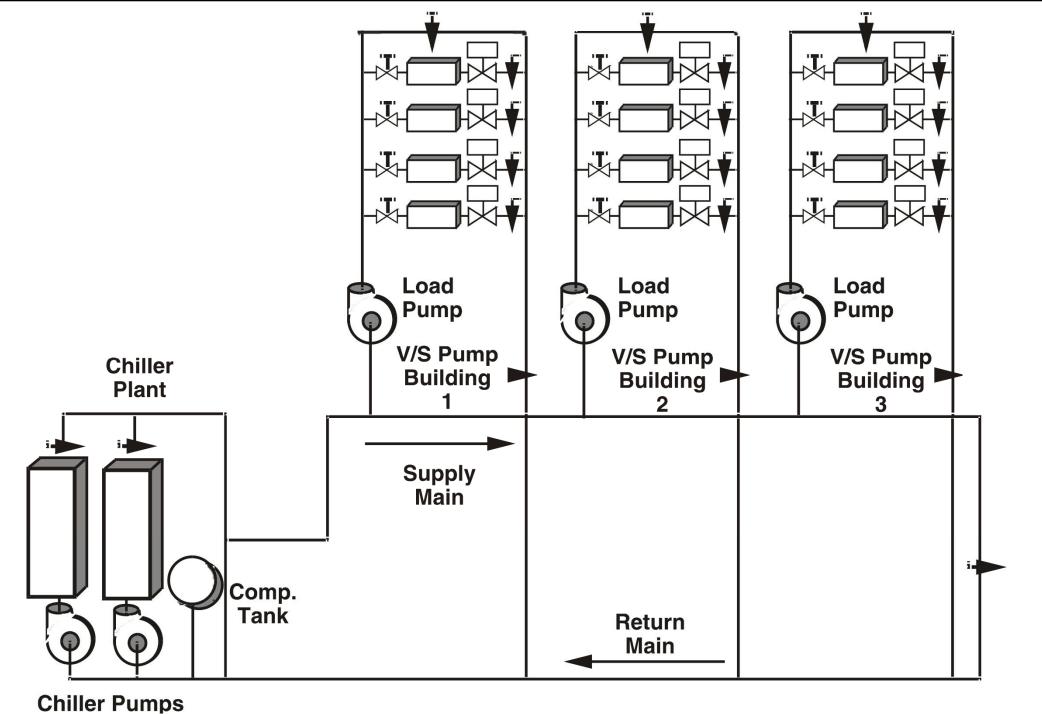

(Source: Wang, S. K., 2001. Handbook of Air Conditioning and Refrigeration)

#### Primary-secondary variable speed pumping

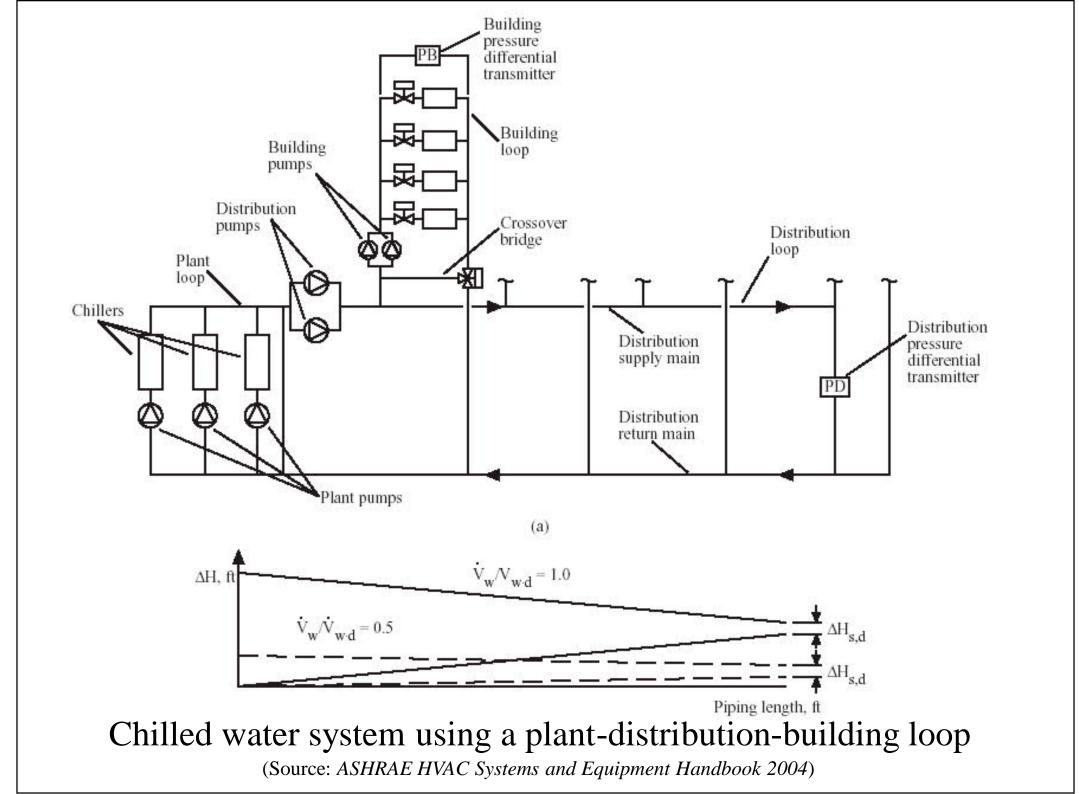

(Source: Fundamentals of Water System Design)

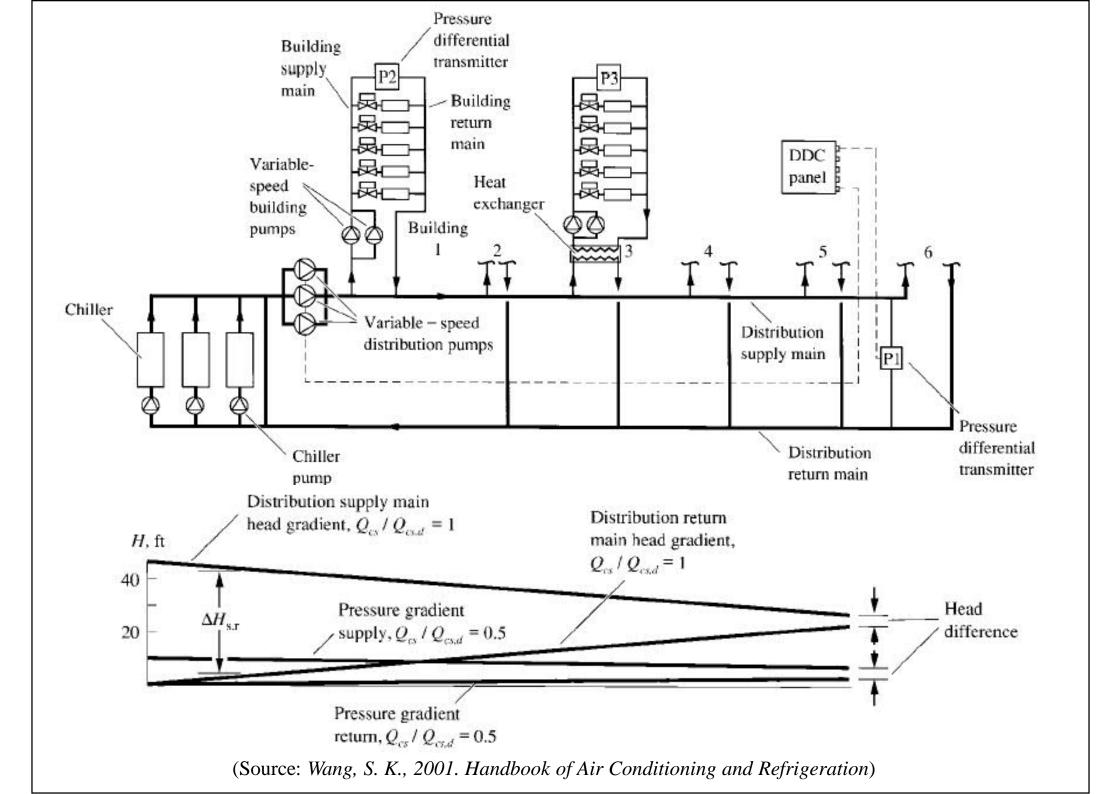

Distributed varia

#### Distributed variable speed pumping

(Source: Fundamentals of Water System Design)

# **Matching Pumps to Systems**

- Chiller plant operation/performance management
  - Parallel chiller arrangement
  - Series chiller arrangement
  - Decoupled chiller arrangement
  - Chiller plant control
  - Tertiary pumping
