MEBS6016 Energy Performance of Buildings http://www.mech.hku.hk/bse/MEBS6016/

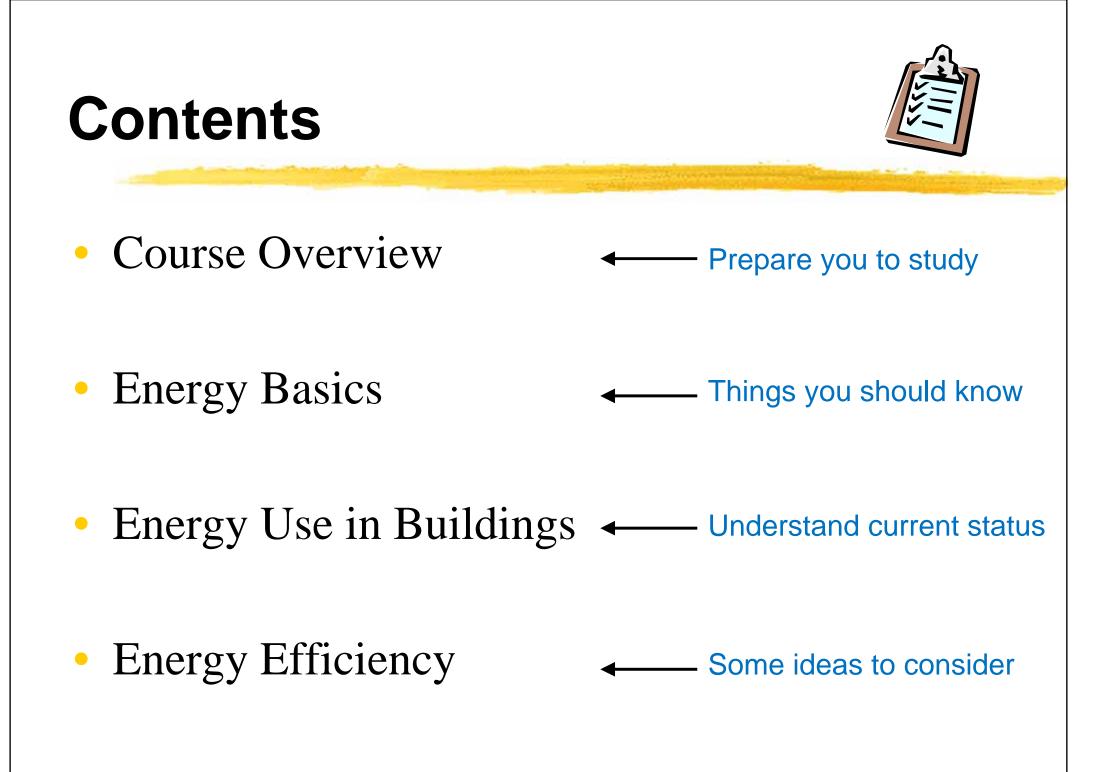

Introduction

Dr. Sam C. M. Hui Department of Mechanical Engineering The University of Hong Kong E-mail: cmhui@hku.hk

- MEBS6016 Energy Performance of Buildings
- Lecturers:

Dr. Sam C. M. Hui

- Email: <u>cmhui@hku.hk</u>
- Office: Room 7-22, Haking Wong Bldg.

Dr. JIANG Wei

- Email: jiangwei@gmail.com
- Associate Director, WSP Hong Kong Ltd.

EPB

• Dr. Sam C. M. Hui

- PhD, BEng(Hons), CEng, CEM, MASHRAE, MCIBSE, MHKIE, MIESNA, LifeMAEE, AssocAIA
- ASHRAE Distinguished Lecturer (2009-11)
- CEng = Chartered Engineer
- CEM = Certified Energy Manager
- LifeMAEE = Life Member, Associatn of Energy Engineers
- Worked in 1998 as a visiting researcher in the Asia Pacific Energy Research Centre, Japan
- Research interests: energy efficiency in buildings and sustainable building technologies

• Educational Objectives:

- To understand the important issues associated with energy performance of buildings
- To develop the essential skills for theoretical analysis and practical study of building energy use

• **Duration**:

- About 12 weeks
- 2.5 hours per week

- <u>Learning Outcomes</u>: After completing the course, students will be able to:
 - 1. Describe the important issues and considerations of building energy performance
 - 2. Explain the technologies, codes and policies for energy conservation in buildings
 - 3. Develop the skills for theoretical analysis and practical study of building energy performance

- <u>Study Topics</u>:
 - 1) Introduction
 - 2) Energy efficiency in buildings (I) & (II)
 - 3) Energy information systems
 - 4) Energy auditing of buildings
 - 5) Economic and financial analysis
 - 6) Energy efficient technologies
 - 7) Building energy standards & codes
 - 8) Building energy simulation

Dr. JIANG Wei

Dr. Sam Hui

• Learning Methods:

- Lectures
- Assigned Reading
- Exercises
- Learning Resources:
 - References
 - Web Links
 - Course Website
 - Moodle

• Assessment Method

- Written Examination (100%)
 - 2-hour written exam
- <u>References</u>
 - No required textbook

- See reference list for some selected useful books
- Useful info can also be found on the web links

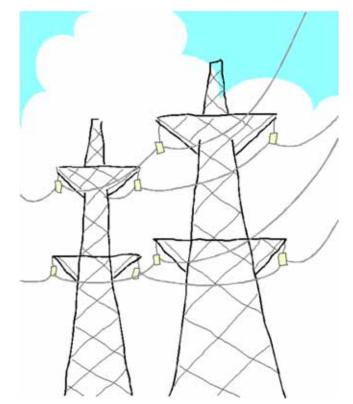

- Units of energy*
 - Kilowatt-hour (kWh), 1 kWh = 3.6×10^6 joule
 - 1 kWh = 3.6 MJ = 860 kcal = 3412 Btu
 - Calorie (卡路里), 1 calorie (cal) = 4.2 x 10³ J
 - British thermal unit (Btu), 1 Btu = $1.055 \times 10^3 \text{ J}$
 - Therme (gas supply), 1 therme = 100 000 Btu
 - Tonne of oil equivalent (toe) (from oil industry)
 - 1 toe = $4.2 \times 10^{10} \text{ J} = 42 \text{ GJ}$ or 11.63 MWh or 10^7 cal
- Power unit:
 - 1 W = 1 J/s = 0.86 kcal/h = 3.41 Btu/h

(*See also <u>http://www.aps.org/policy/reports/popa-reports/energy/units.cfm</u>)

- Forms of energy: (*Supply side, primary energy*)
 - Electricity (most important)*
 - Natural gas, town gas, liquified petroleum gas (LPG)
 - Oil products
 - Coal
 - Hydropower
 - Renewable energy (e.g. solar, wind)
 - Nuclear energy

(*See also <u>http://en.wikipedia.org/wiki/World_energy_consumption</u>)

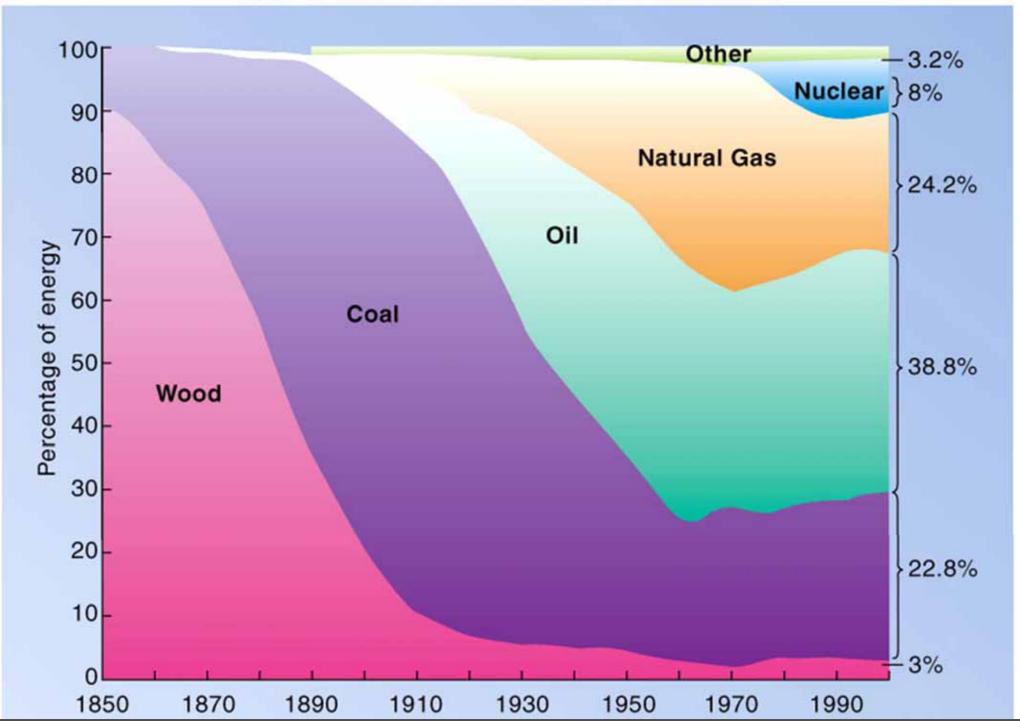

- Energy end-use: (*Demand side, final energy*)
 - Air-conditioning and ventilation
 - Lighting
 - Equipment
 - Hot water
 - Cooking
 - Industrial processes
 - Transportation

Changes in Energy Sources in Year 1850-2000

Copyright @ The McGraw-Hill Companies, Inc. Permission required for reproduction or display.

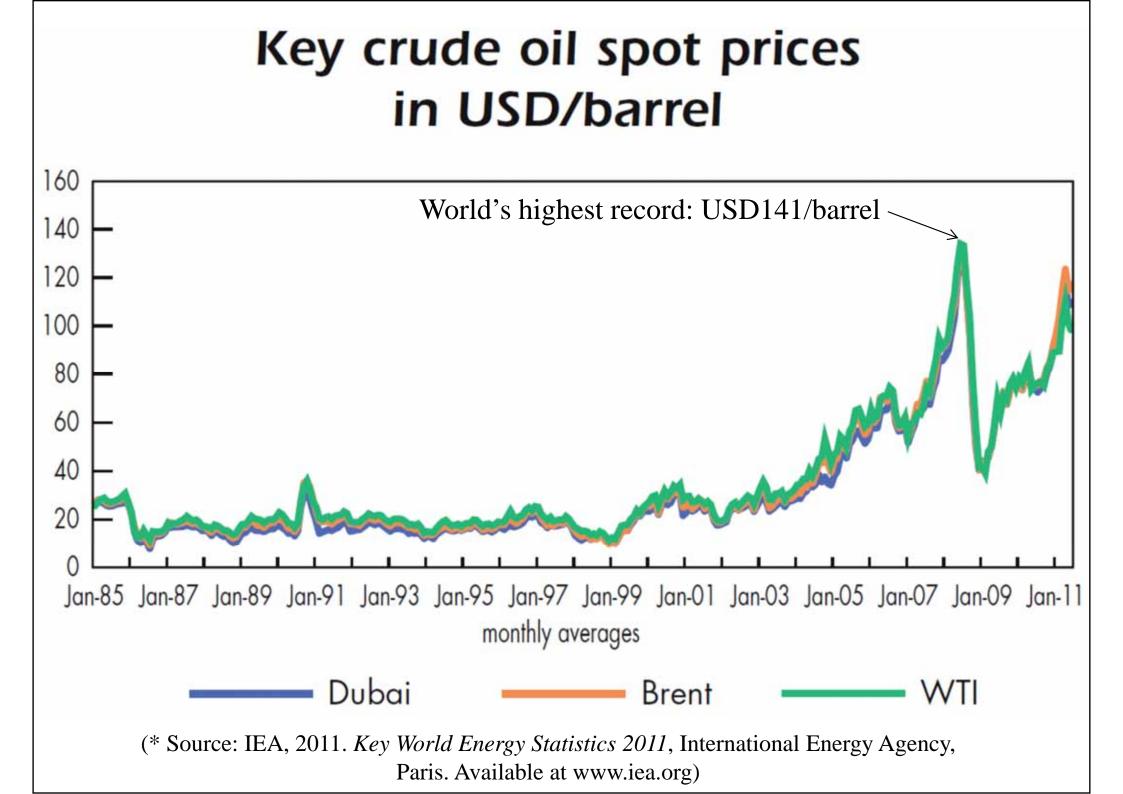

- **Energy** is important to every society
 - Economic, environmental & social impacts
 - It is also a key issue for *sustainable development*
- Use energy ...
 - Consume finite fossil fuels (oil, coal, natural gas)
 - Cause air pollution & environmental damage
 - Contribute to global warming
 - Cost money

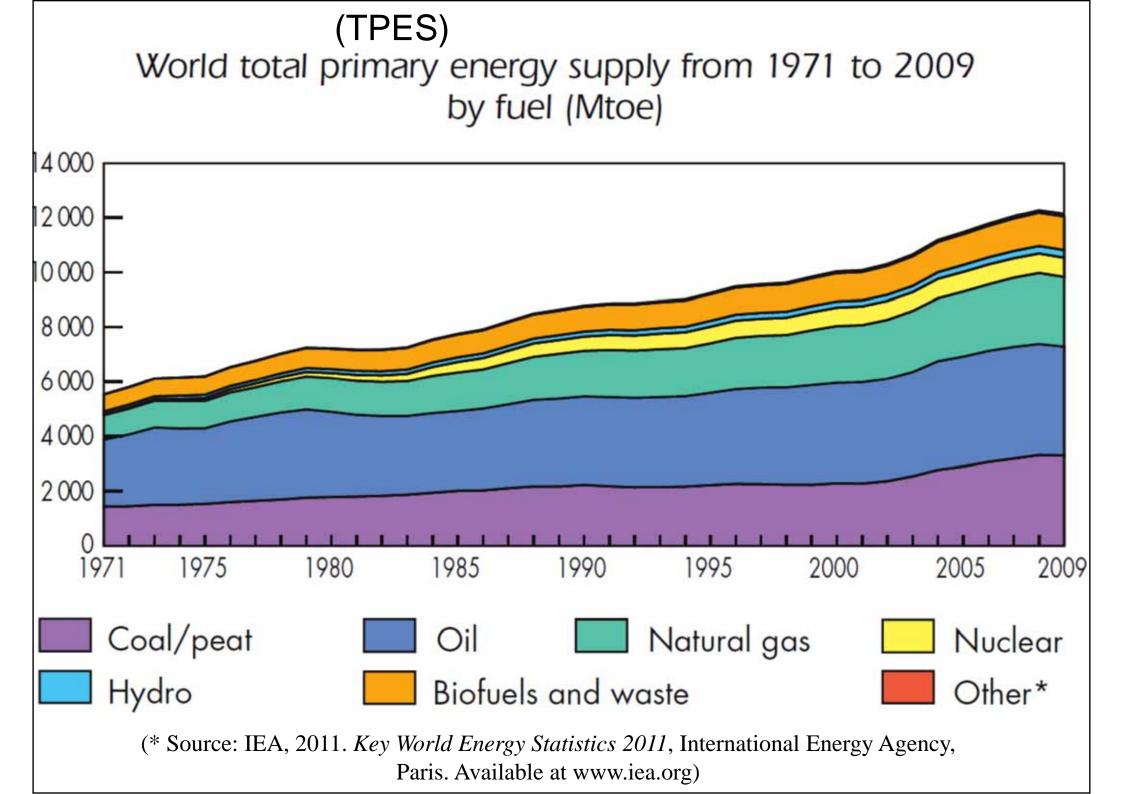

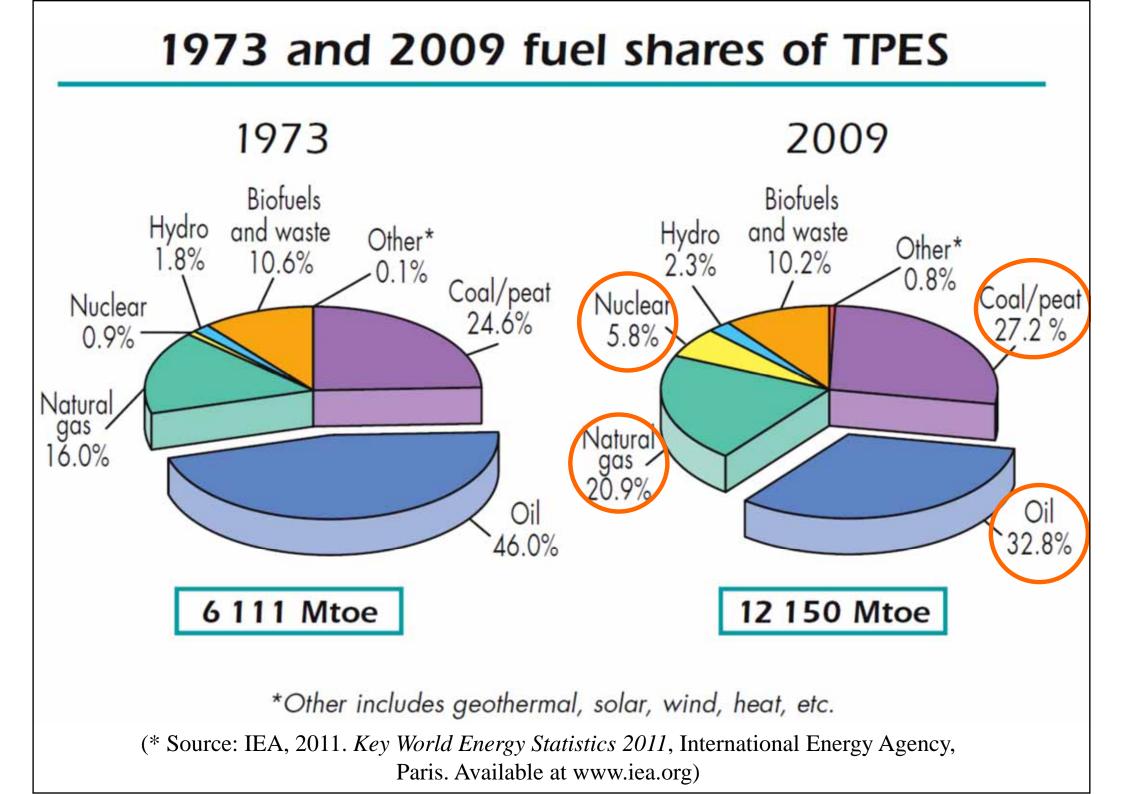

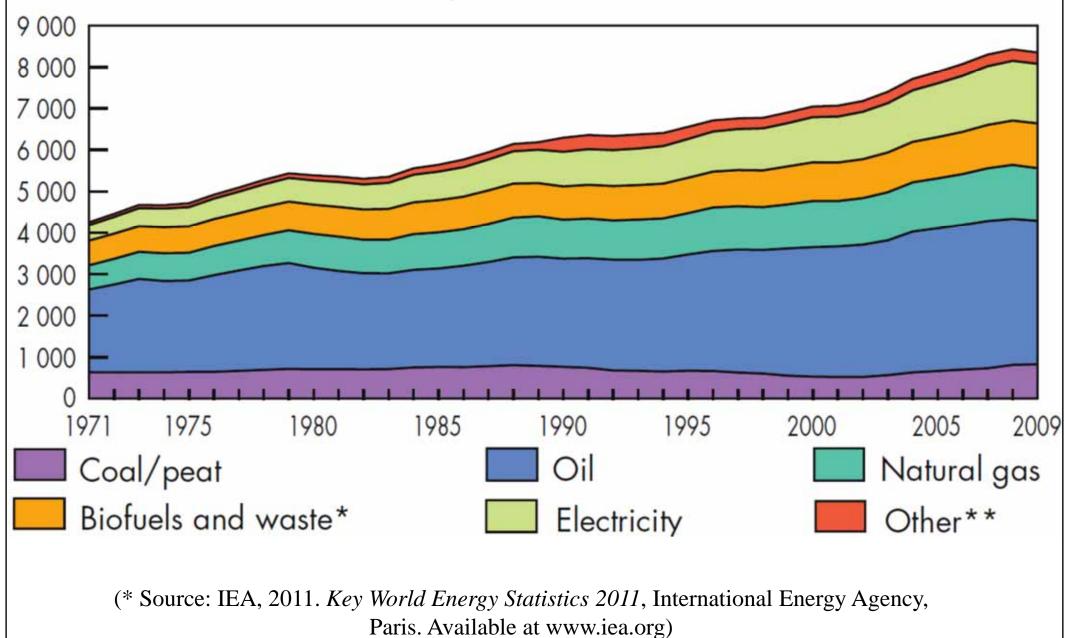

- History of energy issues in the modern world
 - **1970s** (oil crises): to preserve supplies of what were thought to be scarce fuels
 - **1980s**: emphasize on cost effectiveness of energy efficiency (drop in oil price)
 - **1990s**: to reduce the impact of energy use on the environment (esp. control greenhouse gases)
 - **2000s**: to achieve sustainable energy future

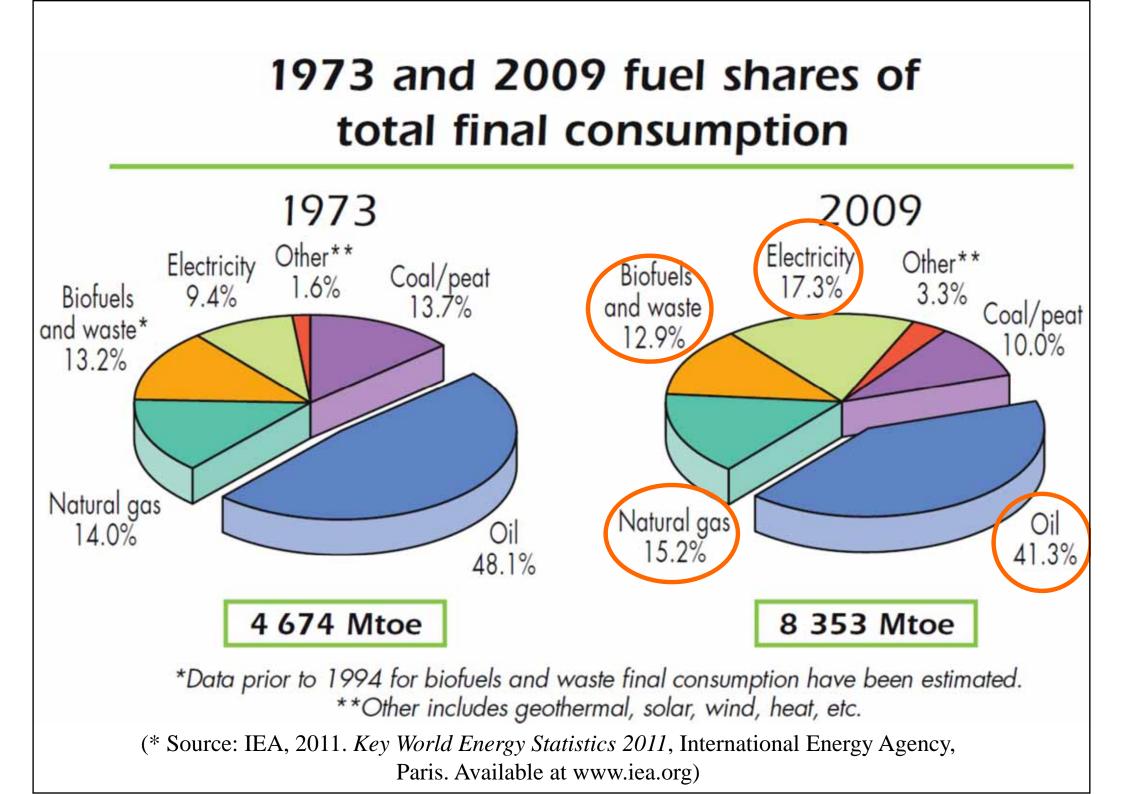

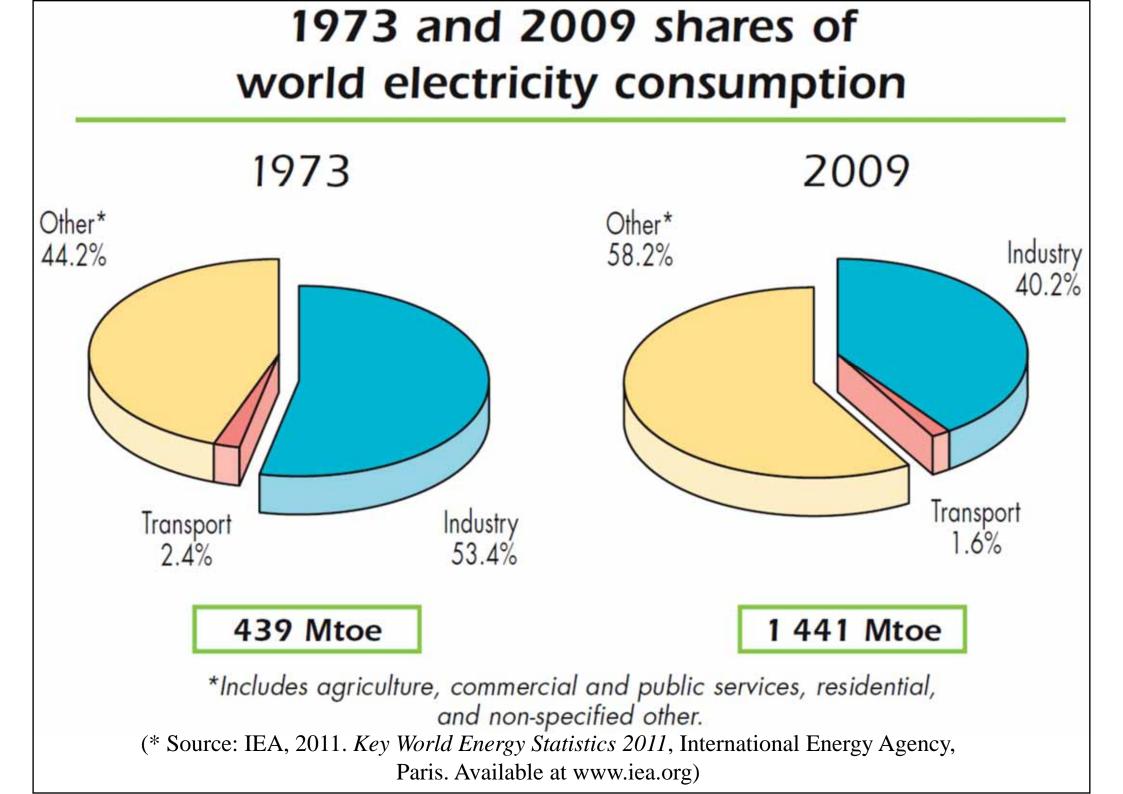

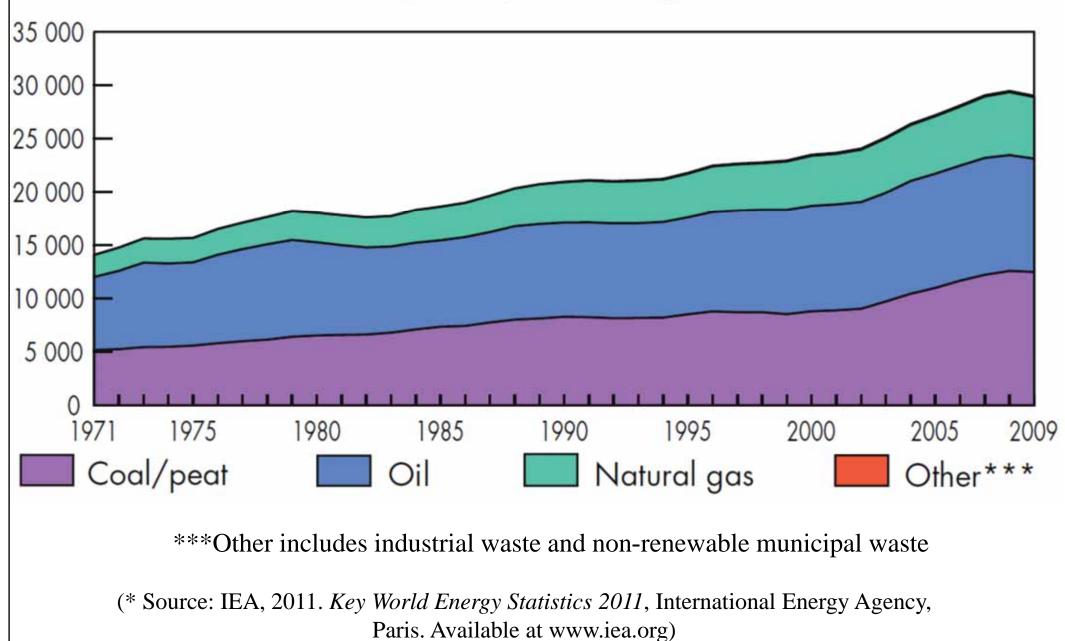

World total final consumption from 1971 to 2009 by fuel (Mtoe)

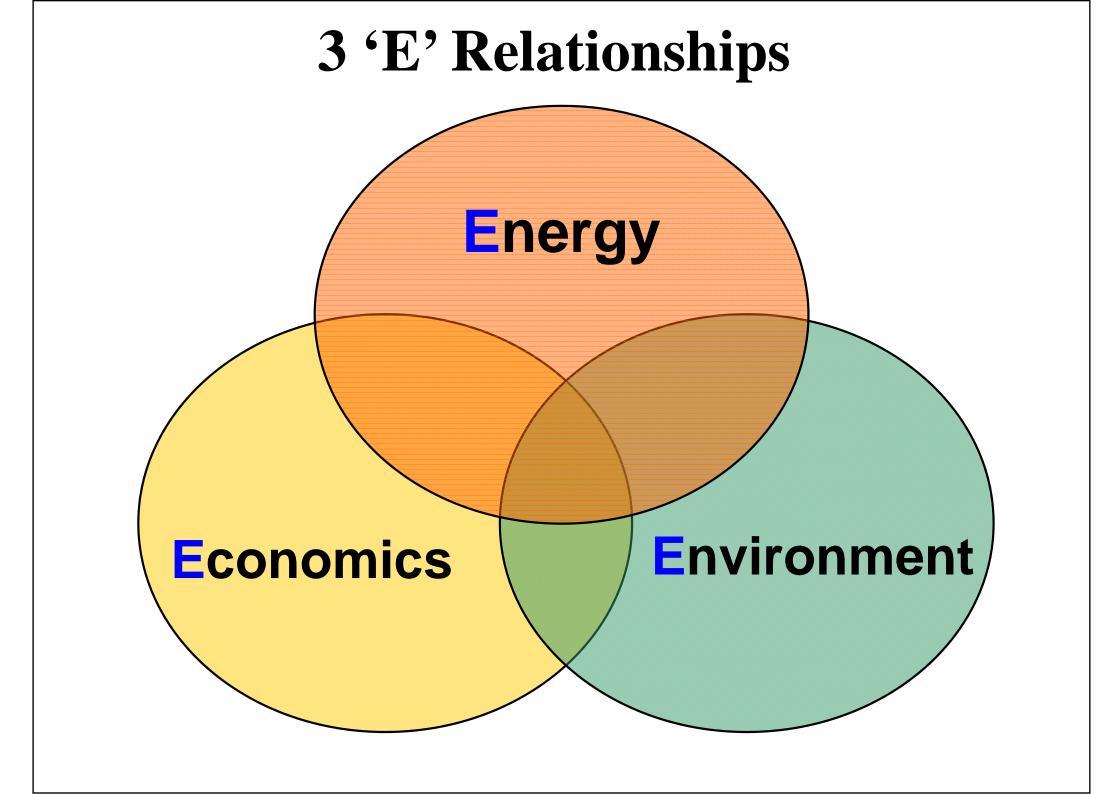

World* CO₂ emissions** from 1971 to 2009 by fuel (Mt of CO₂)

Energy indicators for 2009								
Economy	Population (million)	GDP/pop (yr2000 USD)	TPES/pop (toe/ capita)	TPES/GDP (toe/yr2000 USD)	CO₂/pop (t CO ₂ / capita)	CO ₂ /GDP (kg CO ₂ / yr2000 USD)		
World	6761	5.87	1.80	0.31	4.29	0.73		
China	1331	2.21	1.70	0.77	5.13	2.33		
India	1155	0.76	0.58	0.77	1.37	1.81		
USA	307	36.94	7.03	0.19	16.9	0.46		
Japan	127	38.26	3.71	0.10	8.58	0.22		
Germany	82	24.41	3.89	0.16	9.16	0.38		
Hong Kong	7	33.05	2.13	0.06	6.51	0.2		
Singapore	5	28.75	3.70	0.13	8.99	0.31		

(* Extracted from: IEA, 2011. Key World Energy Statistics 2011, International Energy Agency, Paris. Available at www.iea.org)

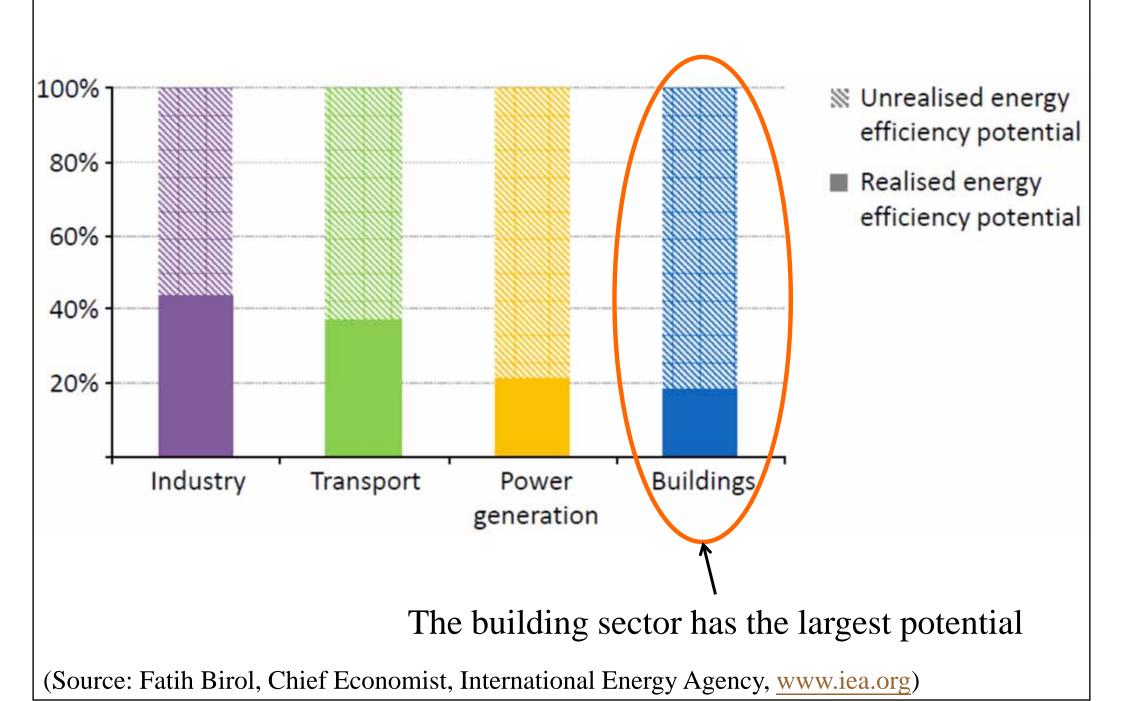

- Significance of energy management
 - Economics
 - Energy costs and operating costs
 - Energy security

- Energy supply (political and economic reasons)
- Environment
 - Climate change, global warming, air pollution
- Resources depletion
 - Oil, gas and coal will be used up

Energy efficiency potential used by sector: a huge opportunity going unrealised

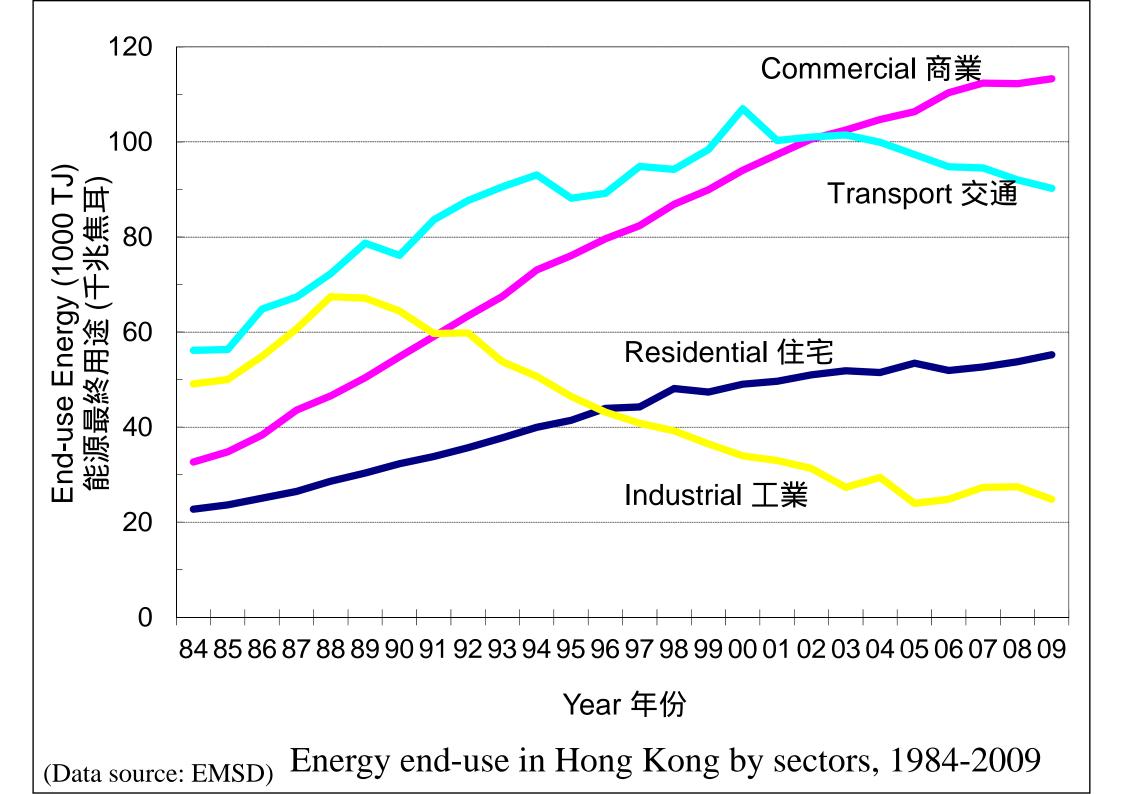

Energy Use in Buildings

- About 90% of total electricity consumption in Hong Kong is contributed by buildings
- Buildings constitute 30-50% of energy needs
 - Residential + commercial + industrial
 - The potential for energy saving is large
- The <u>real cost</u> of energy
 - Energy price + Environmental costs (e.g. \$\$ for pollution control & "repairing" of environmental damages)

Energy Use in Buildings

- Possible benefits from energy efficiency:
 - 1. Improved building design and operation
 - 2. Better working environments
 - 3. Life-cycle cost savings
 - 4. Added market value of buildings
 - 5. Reduced CO₂ emissions and consumption of finite fossil fuels
 - 6. Reduced capital cost by better integration of building fabric and systems

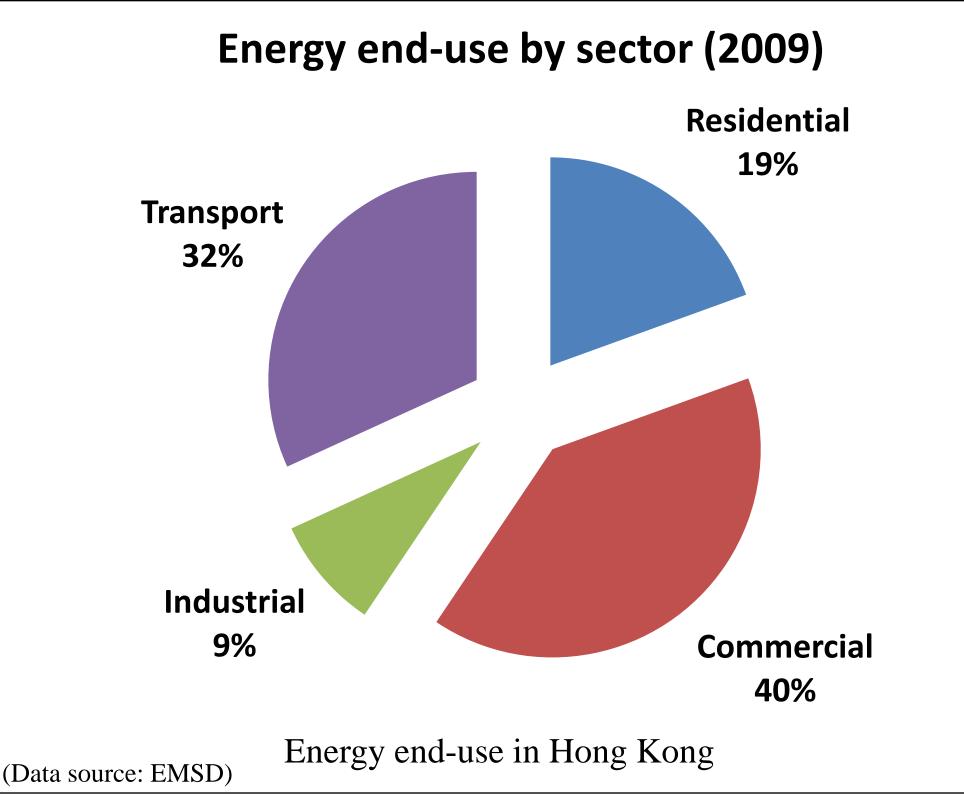

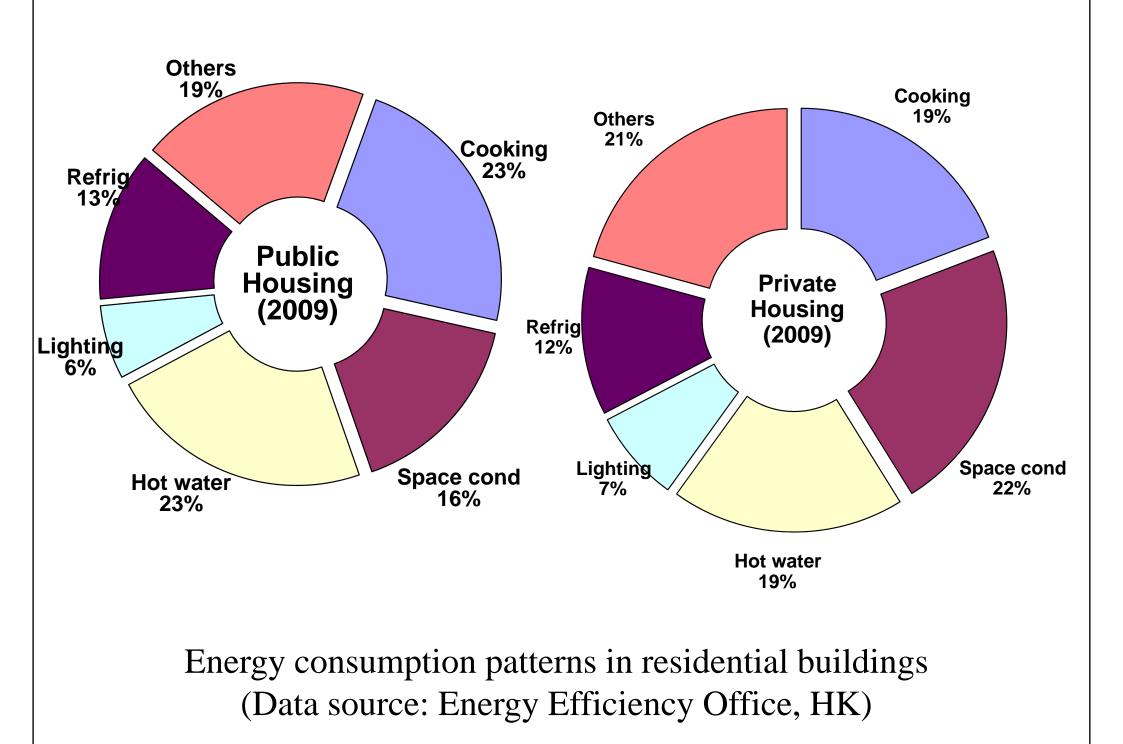

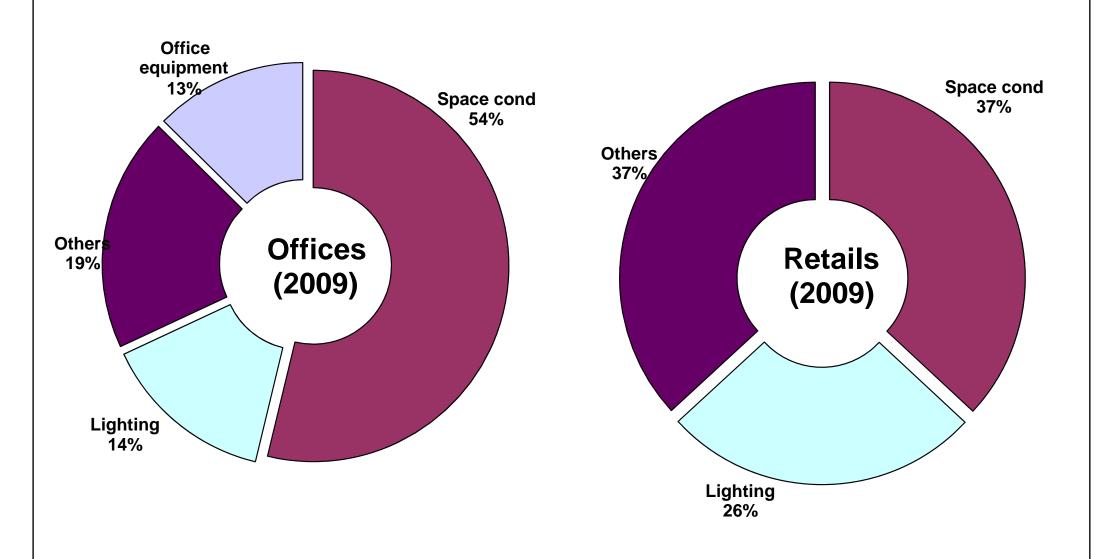

Table 1 - Final energy requirements (FER)in Hong Kong (year 2010)

Unit: MJ	Commercial	Residential	Industrial	Total
Electricity	100 280 (67%)	39 344 (26%)	11 080 (7%)	150 705 (100%)
Town gas	11 389 (41%)	15 272 (55%)	917 (3%)	27 578 (100%)
Elec. + town gas	111 669	54 616	11 997	178 283
% in total FER	37.5%	18.4%	4.0%	59.9%

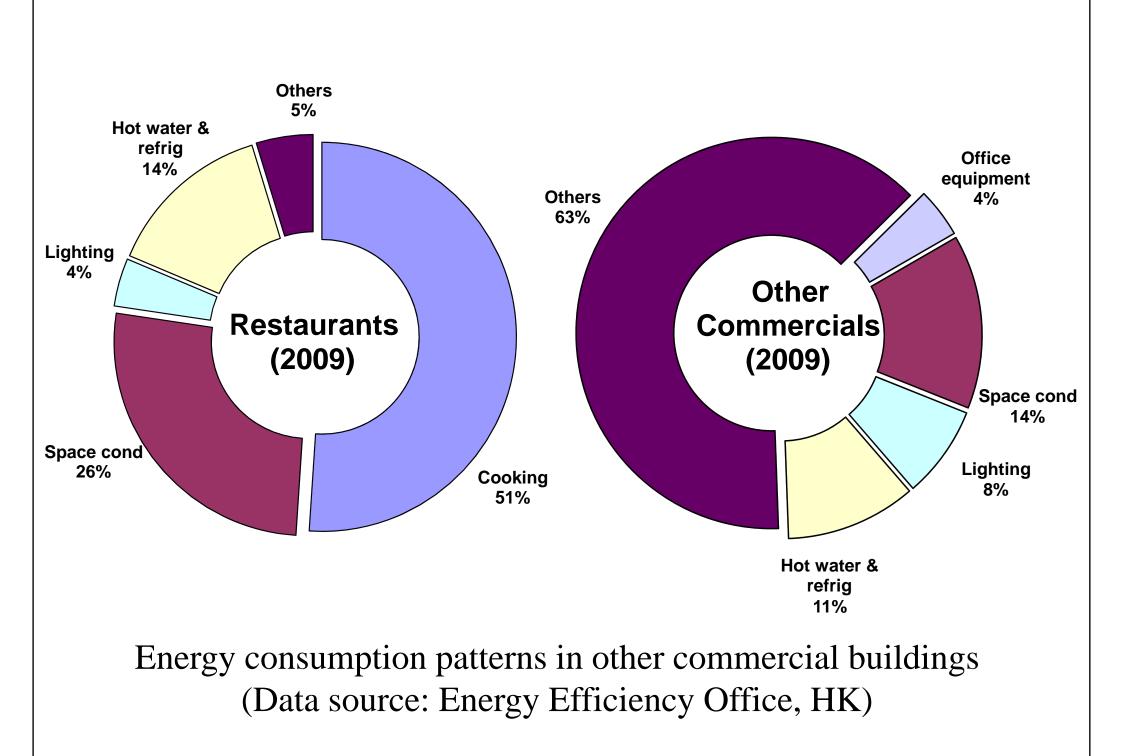

Total FER for 2010 = 297 488 TJ

(See http://www.beeo.emsd.gov.hk for details)

Energy flow and concept in buildings

- Key persons in building energy efficiency
 - Building Developer or Owner (Client)
 - Architect
 - Building Services Engineer
 - Building/Facility Manager
 - End-Users

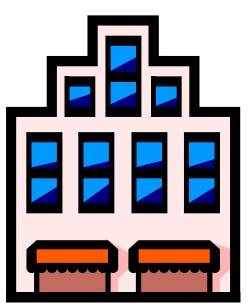

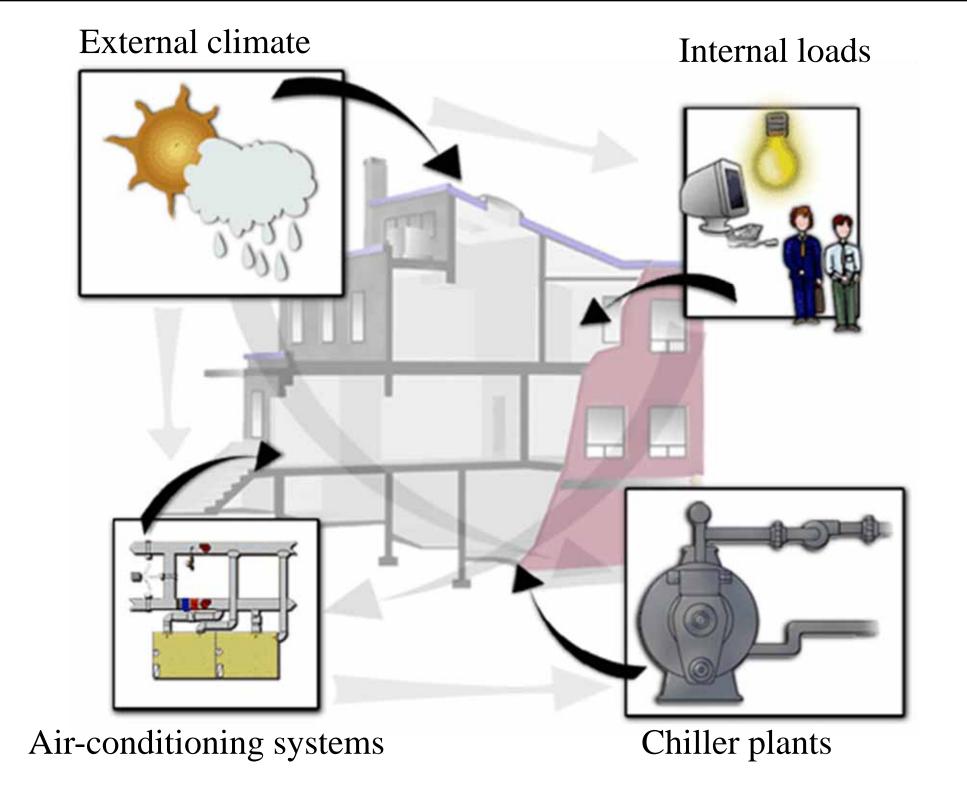

• For new buildings

- Designing the building
 - Design strategy
 - Control strategies
 - Commissioning
- For existing buildings
 - Operating and upgrading the building
 - Building management
 - Refurbishment/renovation/retrofitting
 - Maintenance and monitoring

- Efficient use of energy
 - Reduce energy consumption
 - Optimise building's performance
- Major factors to consider
 - 1. Response to local climate (temperature, humidity, solar radiation)
 - 2. Building envelope (skin) design
 - 3. Building services systems
 - 4. Human factors & building operation

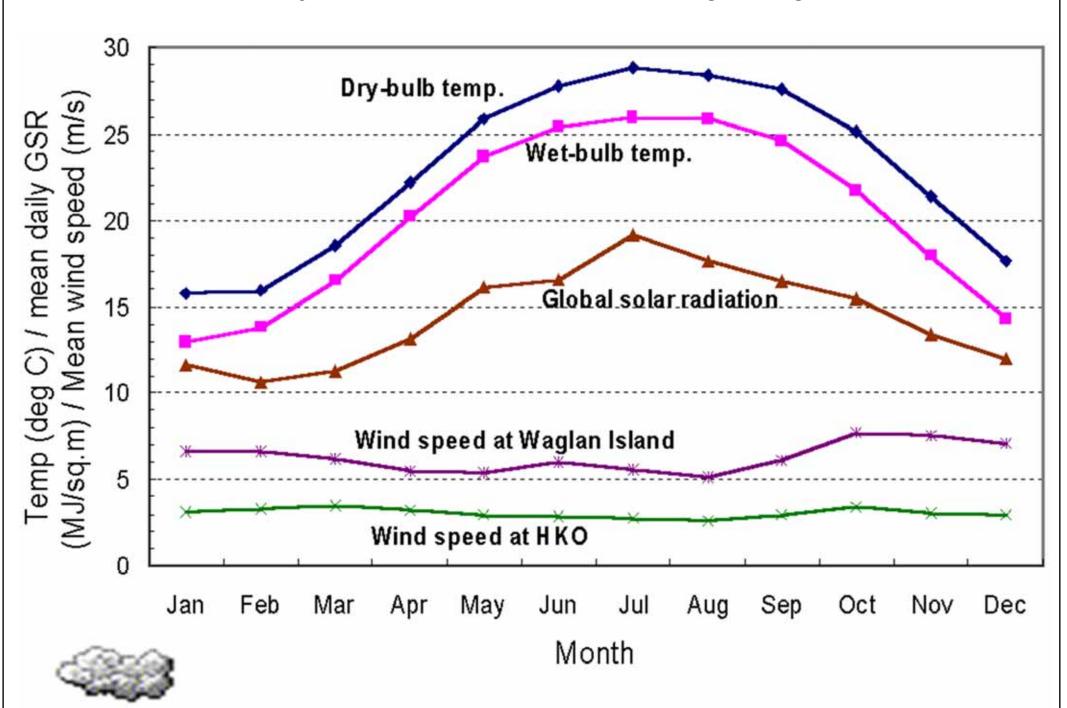

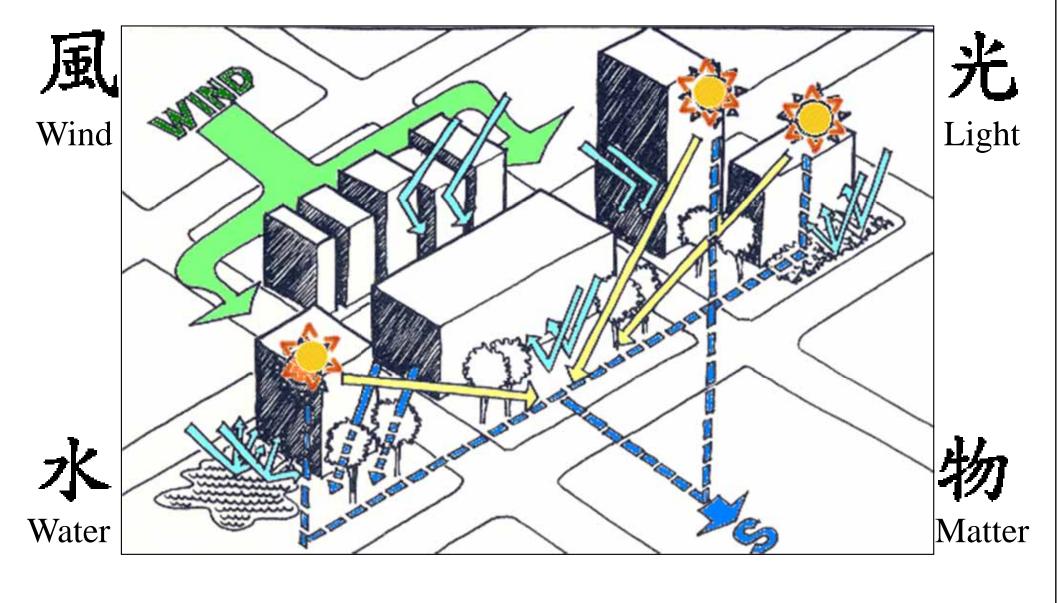

• Climate

- It has a major effect on building thermal and energy performance
- Response of a building to climate:
 - Thermal response of building structure
 - Response of HVAC and lighting systems
- Building design must "fit" its climate
 - Human comfort and bioclimatic design

Major climatic elements of Hong Kong

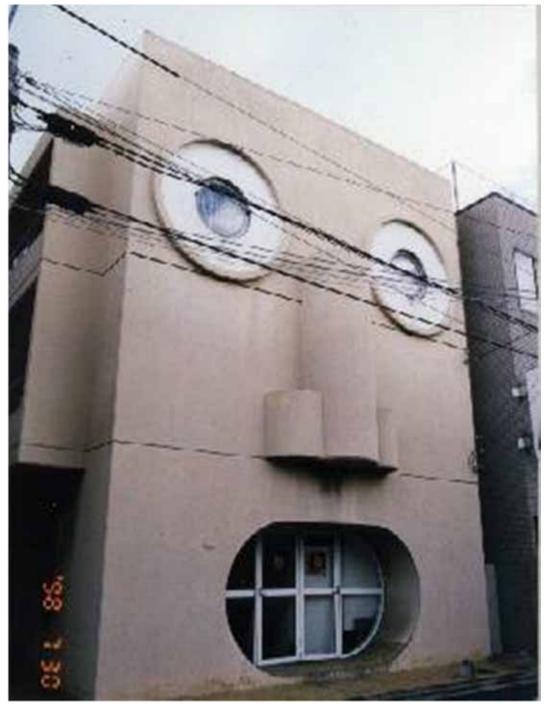

Building designer is like a "Feng Shui" master.

Major site factors

- Building envelope (or skin)
 - Walls, roofs, windows, skylights, etc.
 - Area, thermal properties, mass, shading
 - Good design
 - Consider & respond to local climate
 - Good thermal performance
 - Appropriate window areas
 - Proper solar control
 - Need to <u>balance</u> with other requirements e.g. aesthetics and view (connect to outside)

Look at me. Is my face (building envelope) energy efficient?

Main criteria:

- wall area
- window area
- thermal properties
- orientations
- thermal mass
- shading device

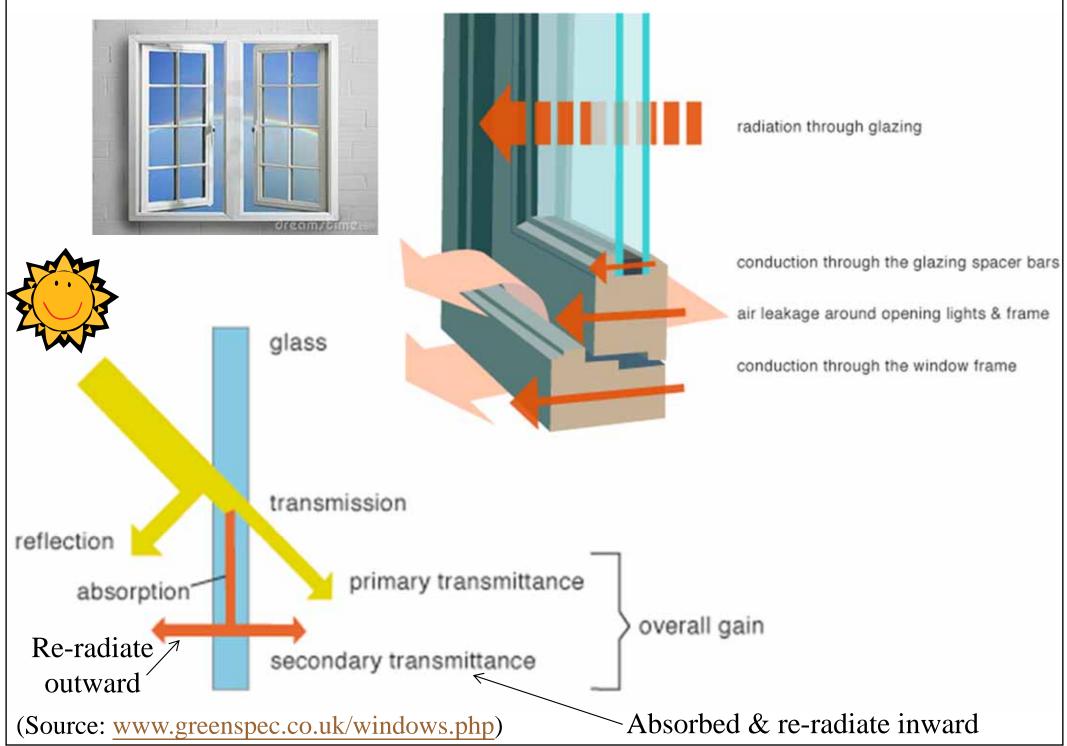

* Face House, Kyoto, Japan

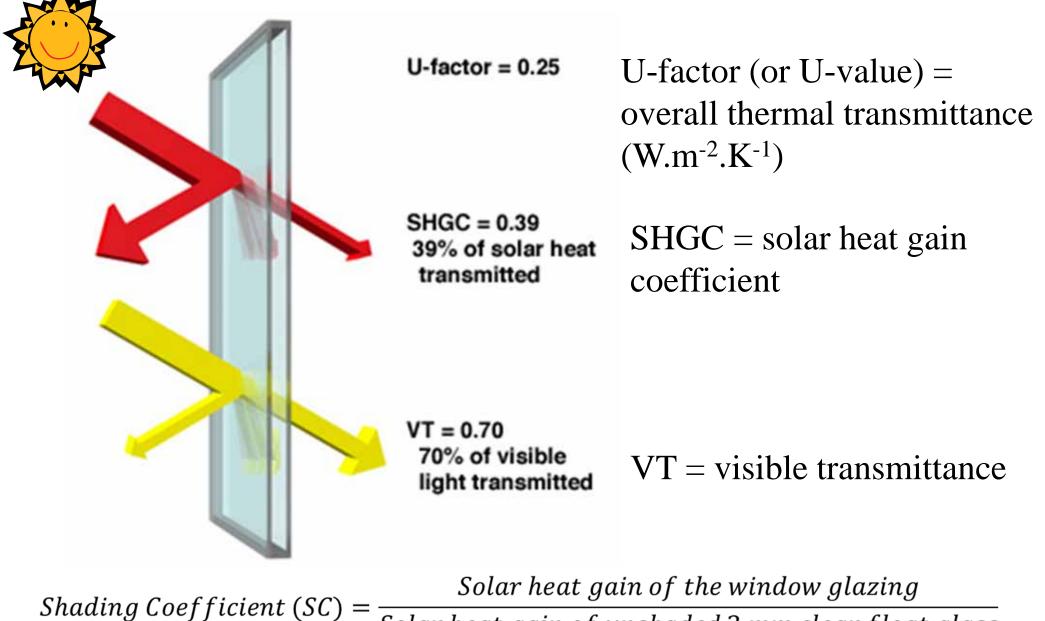

- Major factors determining envelope heat flow:
 - Temperature differential, ΔT
 - Area of exposed building surfaces, A
 - Heat transmission properties, like *U*-value
 - Thermal storage capacity
 - Window-to-wall ratio (WWR)
- Effect of thermal mass
 - Delay heat transfer or act as a cooling source
 - Important for intermittently cooled spaces

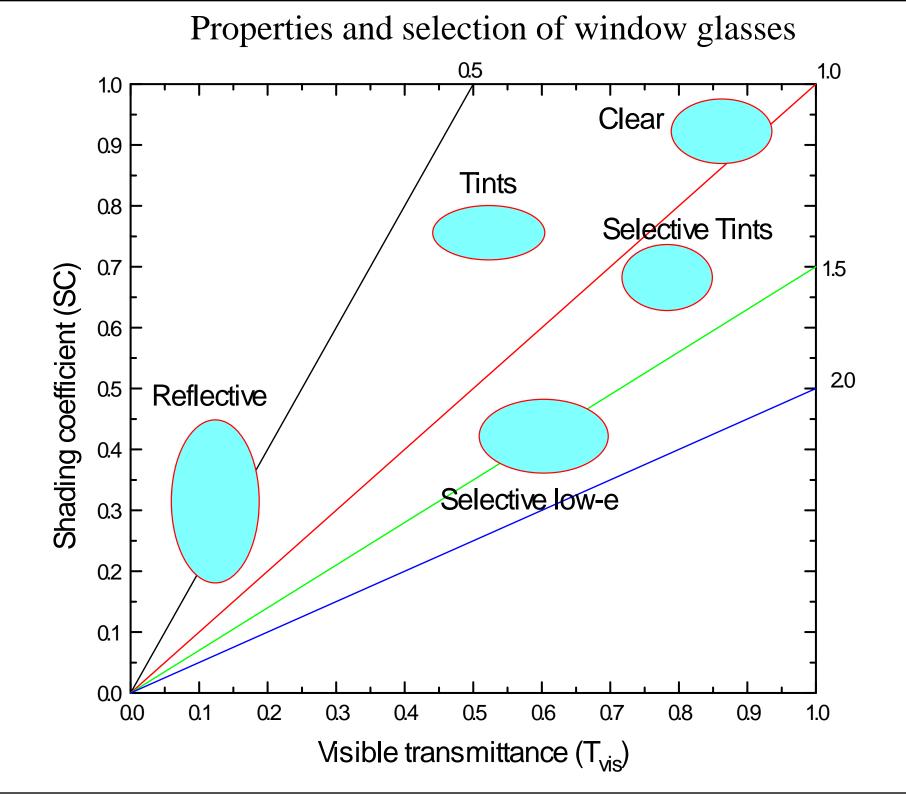

Solar heat gain and heat loss through window glass

Understanding window performance

= \overline{Solar} heat gain of unshaded 3 mm clear float glass

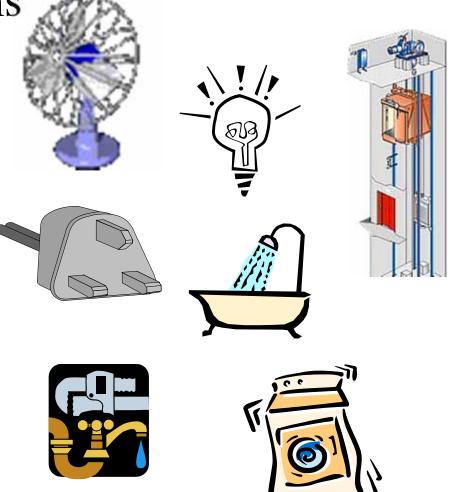

EZ

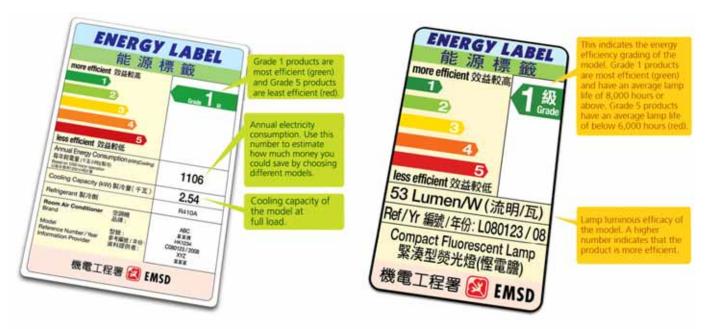

- Architects and Engineers work together to
 - Evaluate envelope performance at early stage
 - Select appropriate window design and materials
 - Design thermal insulation and building fabric
- Complicated issues with building envelope:
 - Dynamic behaviour of climate and building
 - Interaction of light and heat
 - Use of daylighting and solar energy systems

- Building services systems
 - Air-conditioning
 - Lighting
 - Electrical services
 - Lifts & escalators
 - Plumbing & drainage
 - Town gas supply
 - Building management

Energy efficiency labels in HK

Examples of mandatory energy efficiency labels in Hong Kong

Examples of voluntary energy efficiency labels in Hong Kong

(Source: www.energylabel.emsd.gov.hk)

Comparing different grades of energy efficiency labels* 節省能源的百分比 Percentage of Energy Saving					
	空調機 Room Air Conditioners	冷凍器具 Refrigerating Appliances	慳電膽 Compact Fluorescent Lamps	洗衣機 Washing Machines	抽濕機 Dehumidifiers
<mark>第1級比第3級</mark> Grade 1 vs Grade 3	15%	35%	14%	25%	24%
第1級比第5級 Grade 1 vs Grade 5	29%	49%	18%	40%	42%
(*See also Energy Label Net, <u>http://www.energylabel.emsd.gov.hk</u>)					

(Source: <u>www.energylabel.emsd.gov.hk</u>)

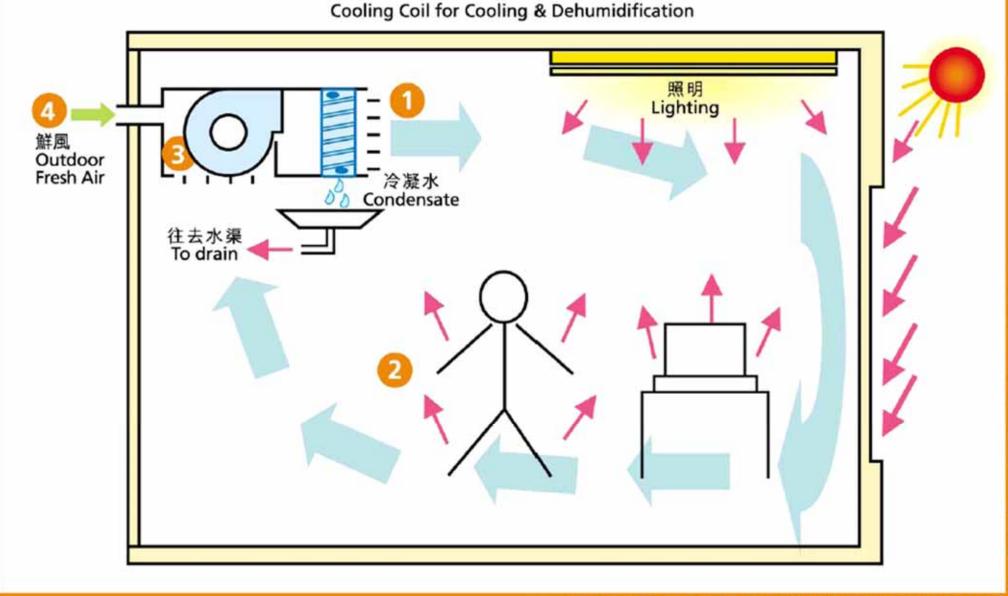

- Heating, ventilating & air-conditioning (HVAC) systems
 - Usually the most important energy users
 - Provide for occupant comfort, health and safety
 - HVAC design is affected by architectural features and occupant needs
- In Hong Kong, heating load is small and main focus is on air-conditioning or cooling energy use

典型空調系統 Typical Air-conditioning Process

EP

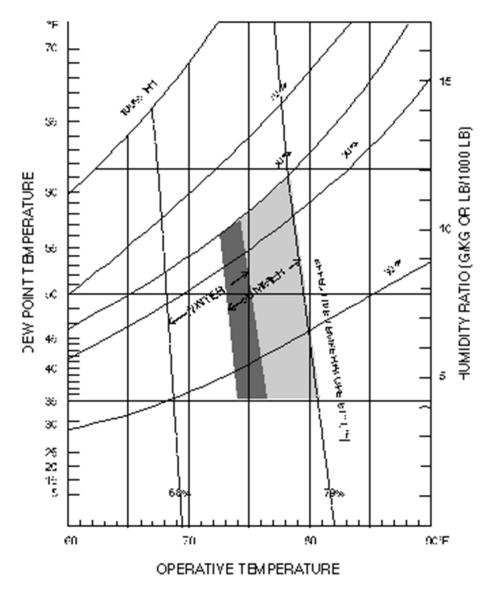

Energy Efficiency

- Strategies for energy efficiency of HVAC*
 - 1. Reduce heat load in the air-conditioned spaces
 - 2. Promote natural cooling or ceiling fans, prior to using mechanical cooling
 - 3. Adopt "relaxed dress code" and flexible work schedule, wherever possible
 - 4. Ensure good house-keeping and user education
- Avoid wastage of energy by proper use of airconditioning and suitable temperature setpoint

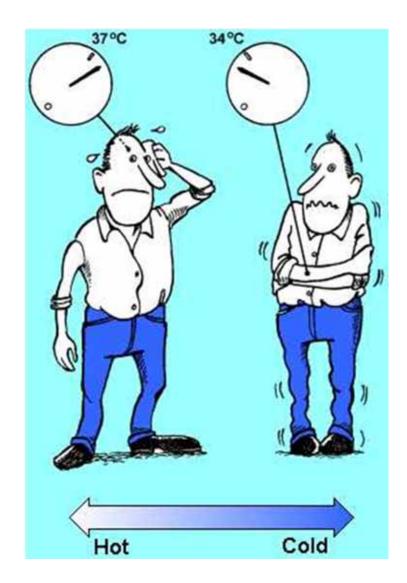

(*See also High-Performance HVAC, <u>http://www.wbdg.org/resources/hvac.php</u>)

Thermal comfort criteria and design

ASHRAE comfort envelope

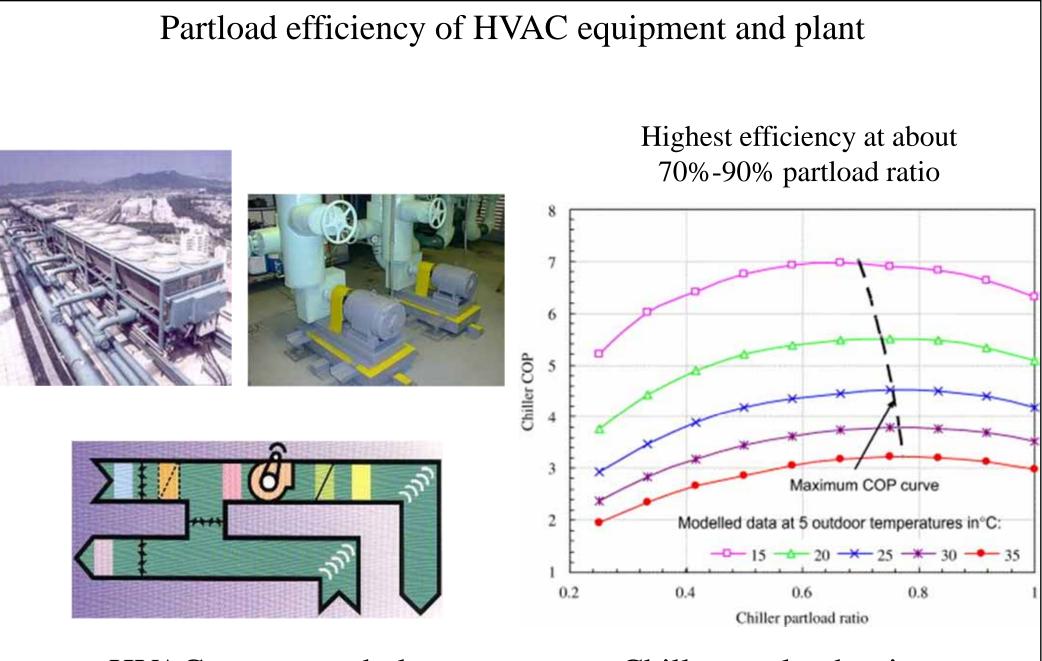

Thermal comfort & design conditions

• HVAC system design and operation

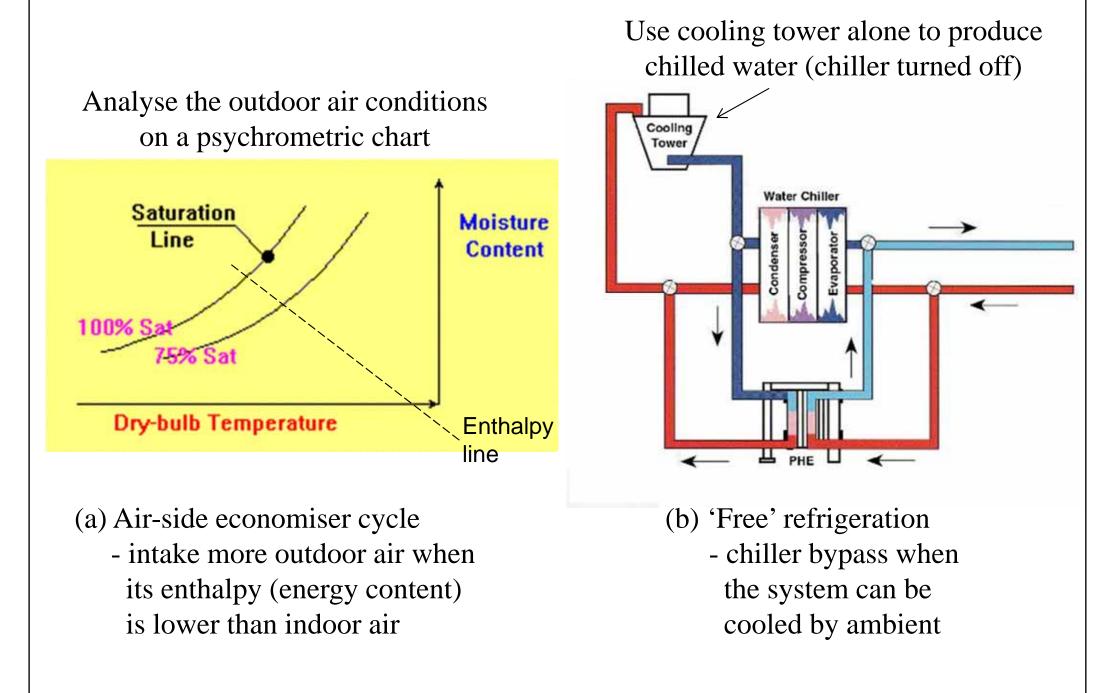

- System characteristics
 - Type of systems
 - Energy efficiency ratios
 - Coefficient of performance
 - System operation & control
- Equipment and plant operation
 - Especially during partload conditions
 - Opportunity for heat recovery
 - District cooling or energy system

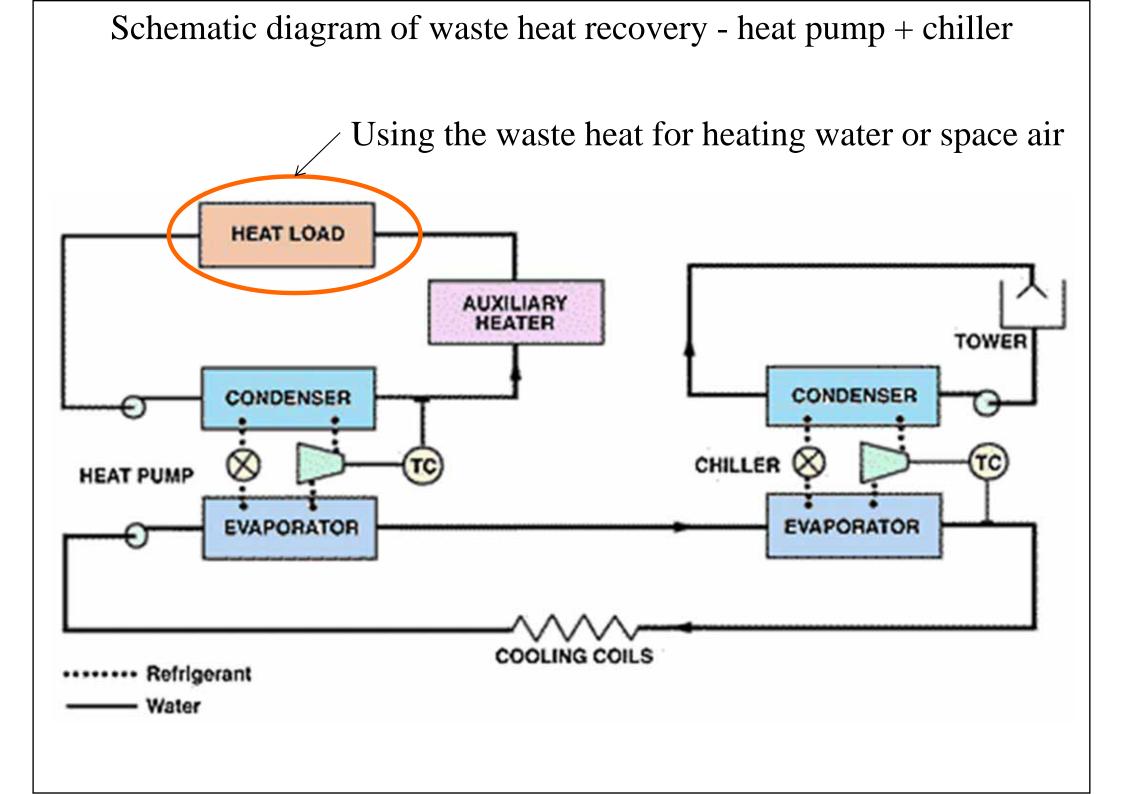

Chiller partload ratio

HVAC system and plant

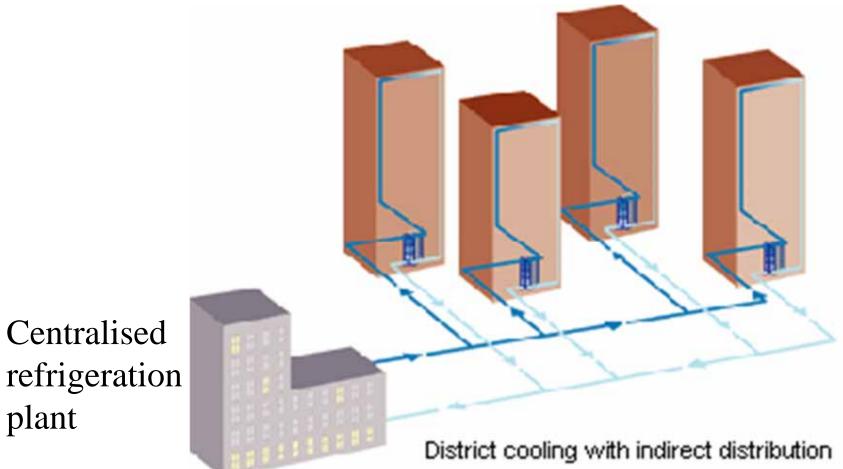

'Free' cooling methods in HVAC system

Basic concept of district cooling system (DCS)

Individual buildings

(Question: Do you know what are the advantages of DCS?)

plant

- HVAC energy efficiency can be improved by:
 - Effective zoning and space design
 - Correct sizing and selection of equipment
 - Proper operation and maintenance
 - Better control and monitoring
 - Energy awareness of occupants/building managers
- Good house-keeping and education
 - A very important factor which is often overlooked

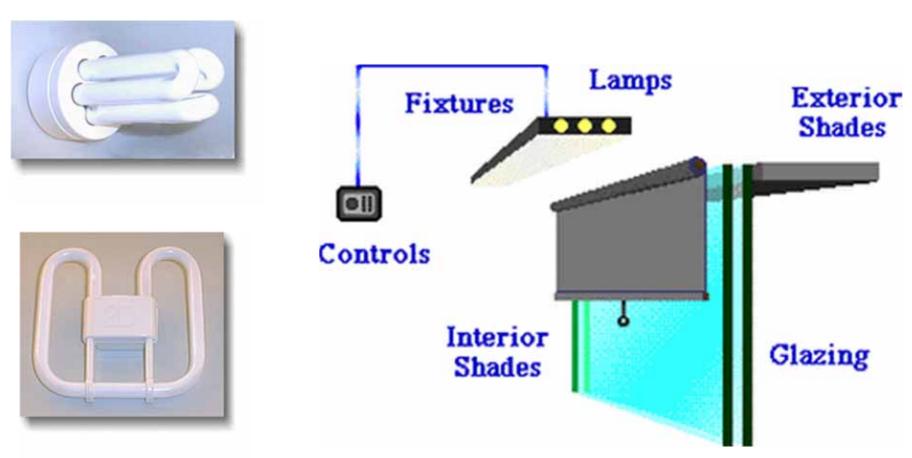

- Lighting systems
 - Have good potential for conserving electricity
 - Also contribute to HVAC load reduction
- General principles of energy efficient lighting*
 - Illumination is not excessive
 - Switching arrangements are designed
 - Provide illumination in an efficient manner

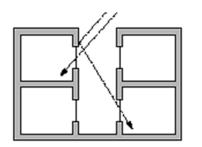

(*See also <u>http://www.wbdg.org/resources/efficientlighting.php</u> and <u>http://www.wbdg.org/resources/daylighting.php</u>)

Energy efficient lighting design strategies

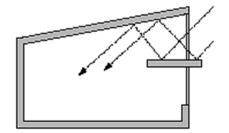

Energy efficient fittings (e.g. compact fluorescent lamps)

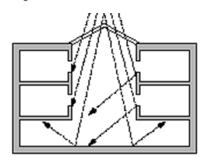

Lighting controls and interactions with windows

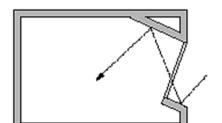

Light well

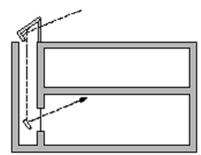

Light shelf

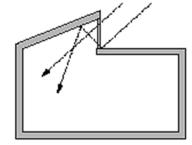

Roof monitor

External reflectors

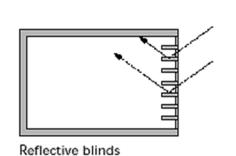

Light duct

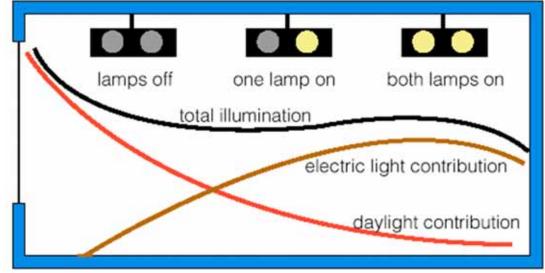

Clerestory

Atrium

Daylighting design and control

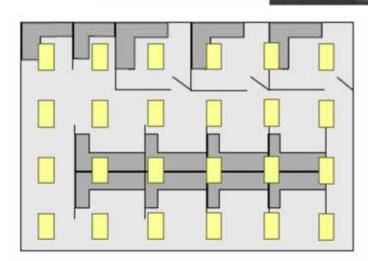

Integrated controls for lighting luminaires

Vertically Integrated Design

Personal Control Features:

- Direct/ Indirect Pendant Luminaire
- Task light: 2T8-PS Dimmable EB (64W)/ 100%-5%
- Ambient light: 1T8-PS EB (31W)/ ON/OFF only
- Photocell Sensor built in
- Occupancy Sensor built in

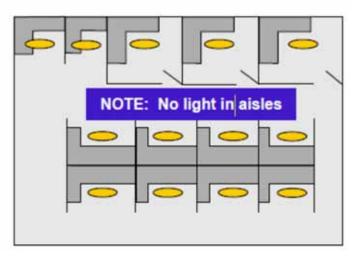

Comparison to a Standard Troffer Layout:

- 2x4 Parabolics
- · 24 Luminaires
- 72 lamps
- ~2300 watts

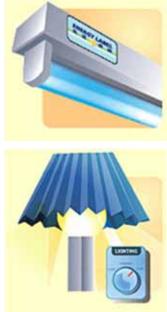

- Direct Indirect
 13 Luminaires
- 39 lamps
- ~1250 watts

(Source: http://lightingdesignlab.com)

EB

- Conserve lighting energy by:
 - (a) Reduce power input
 - Illumination level required, lamp types, ballast, room layouts and colours
 - (b) Reduce hours of use
 - Optimised switching
 - Automatic controls
 - Use of daylight
 - Education and propaganda

- Other building services systems
 - Electrical installation
 - Lifts and escalators
 - Water supply systems

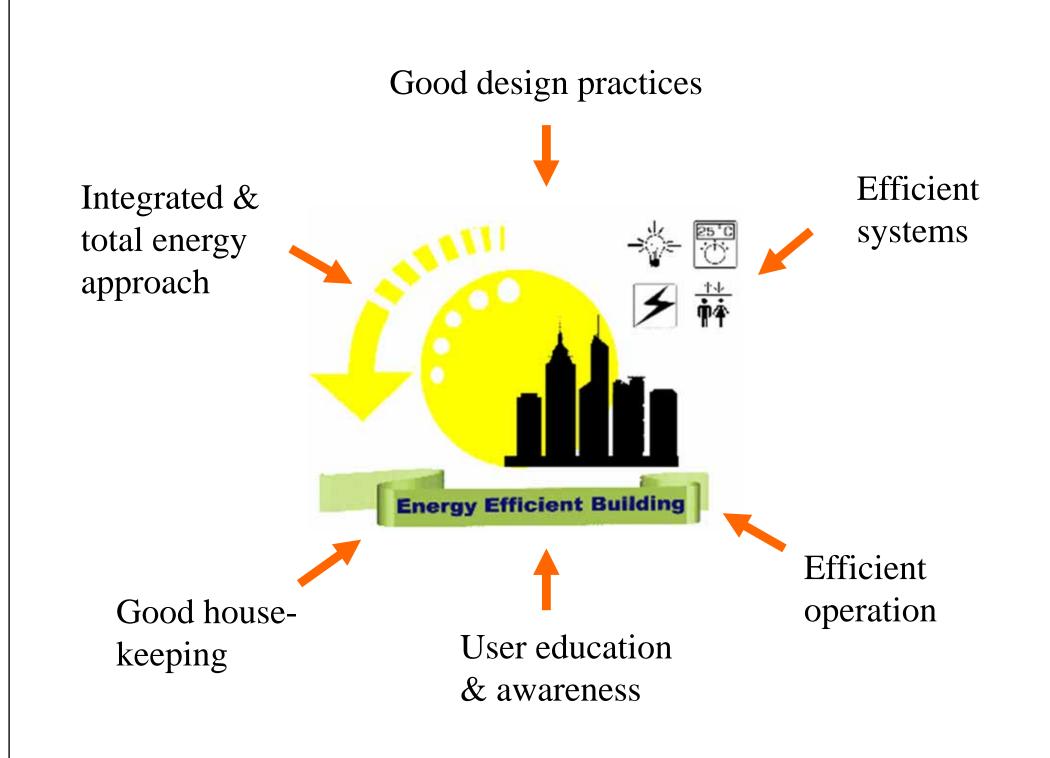

- Town gas supply system (cooking)
- Basic principle for energy efficiency:
 - Energy efficient appliances, correct sizing, design and operation, effective distribution network and proper maintenance

- Human factors
 - Comfort requirements
 - Thermal comfort
 - Visual comfort
 - Noise control
 - Occupant behaviours*
 - Patterns of use
 - Periods of occupation
- Management issues
 - Building use, operation & maintenance

(*See also Energy Saving in Lift System, http://www.mech.hku.hk/bse/save.exe)
