MEBS6020 Sustainable Building Design http://www.hku.hk/bse/MEBS6020/

Sustainable Building Concepts (II)

Dr. Sam C. M. Hui Department of Mechanical Engineering The University of Hong Kong E-mail: cmhui@hku.hk

Aug 2014

Contents

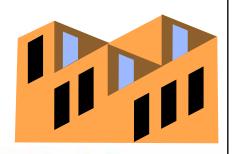

- Energy efficiency
- Renewable energy
- Building materials
- Water issues
- Indoor environment
- Integrated building design

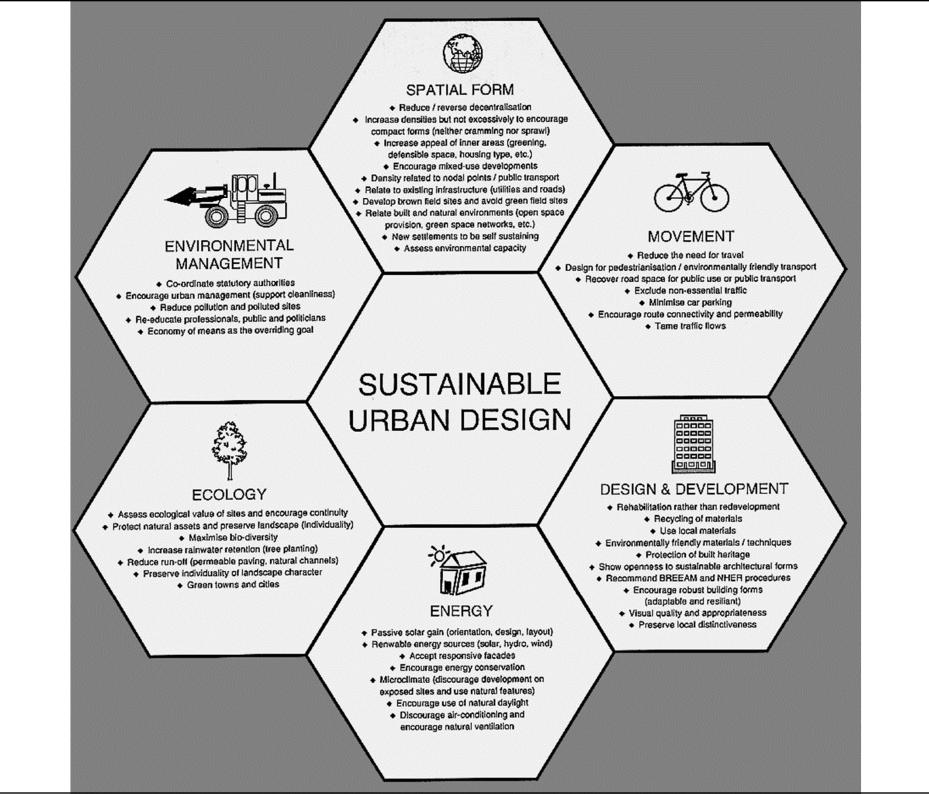

- Planning of development at different *scales*
 - Building, blocks, district, city/town, region
- Good <u>urban design</u> ensures economically viable places and spaces that are:
 - Resource efficient
 - Adaptable
 - Durable
 - Inclusive
 - Fit for purpose

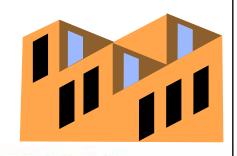

- Sustainable urban design should consider:
 - Spatial form
 - Movement
 - Design & development
 - Energy
 - Ecology
 - Environmental management
- Goal: to create <u>livable cities</u>

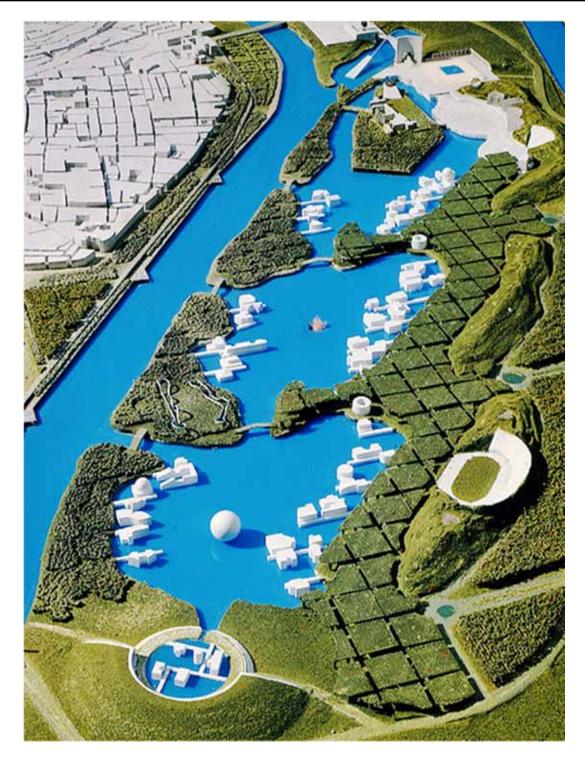

• Basic principles

- 1. Increase local self-sufficiency
- 2. Concern for human needs (social+community)
- 3. Develop energy-efficient movement networks
- 4. The open space network (公共空間)
- 5. Linear concentration
- 6. An energy strategy
- 7. Water strategy

Master plan of EXPO'92, Seville, Spain (designed by Emilio Ambasz)

- The pavilions were removed after the EXPO leaving only the garden park to the city and buildings for the local university.

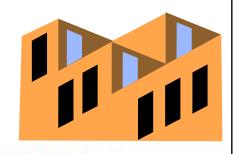

Further info: http://en.wikipedia.org/wiki/Seville_Expo_%2792

• Design issues:

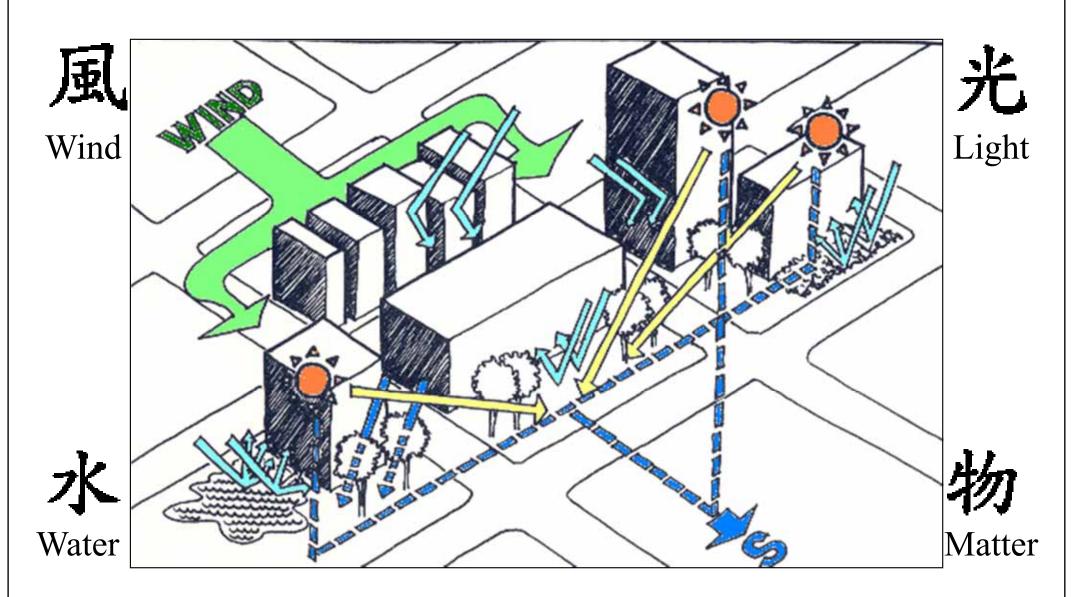

- Site selection (e.g. prefer brownfield site*)
- Promote efficient movement network & transport
- Control & reduce noise impacts
- Optimise natural lighting & ventilation
- Design for green space & landscape
- Minimise disturbance to natural ecosystems
- Enhance community values

[* Brownfield sites are abandoned or underused industrial and commercial facilities available for re-use.]

Design strategies

- Integrate design with public transportation
 - Quite successful in Hong Kong
- Promote mixed use development
 - Such as residential + commercial
- Respect topographical contours (land forms)
- Preserve local wildlife and vegetation
- Make use of landscaping and planting (green space) to modify the local micro-climate

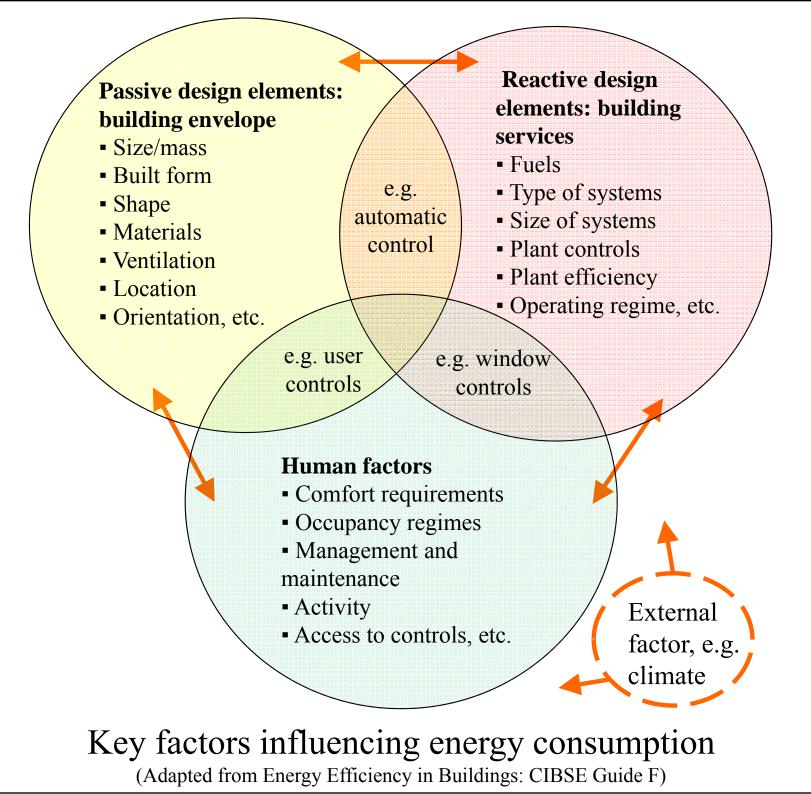

Site analysis and understanding of the environmental factors is important

- The need for energy efficiency
 - Economics
 - Energy costs and operating costs
 - Environment
 - Climate change, global warming, air pollution
 - Energy security
 - Energy supply (political and economic reasons)
 - Resources depletion
 - Oil, gas and coal will be used up

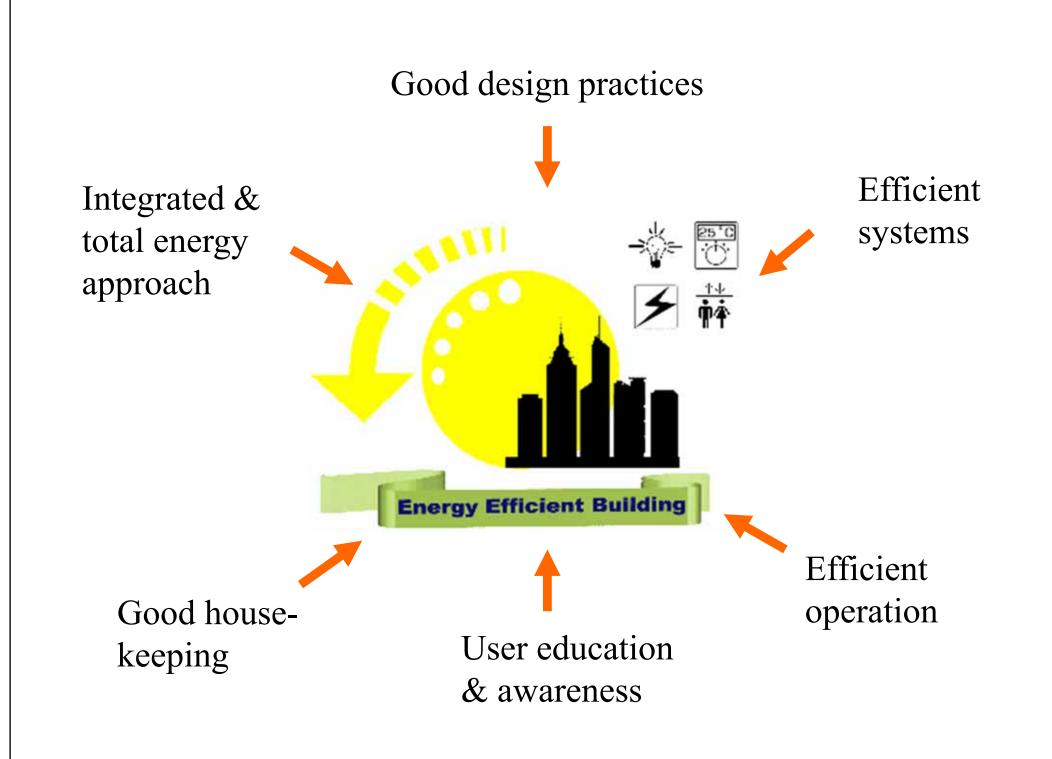

- Building energy efficiency codes
 - Building envelope, such as:
 - HK-OTTV standard
 - Overall thermal transfer value (OTTV)
 - Codes of Practice for building services systems
 - HVAC, lighting, electrical, lifts & escalators
 - Performance-based building energy code
- Become mandatory in 2011 in Hong Kong, under the Buildings Energy Efficiency Ordinance

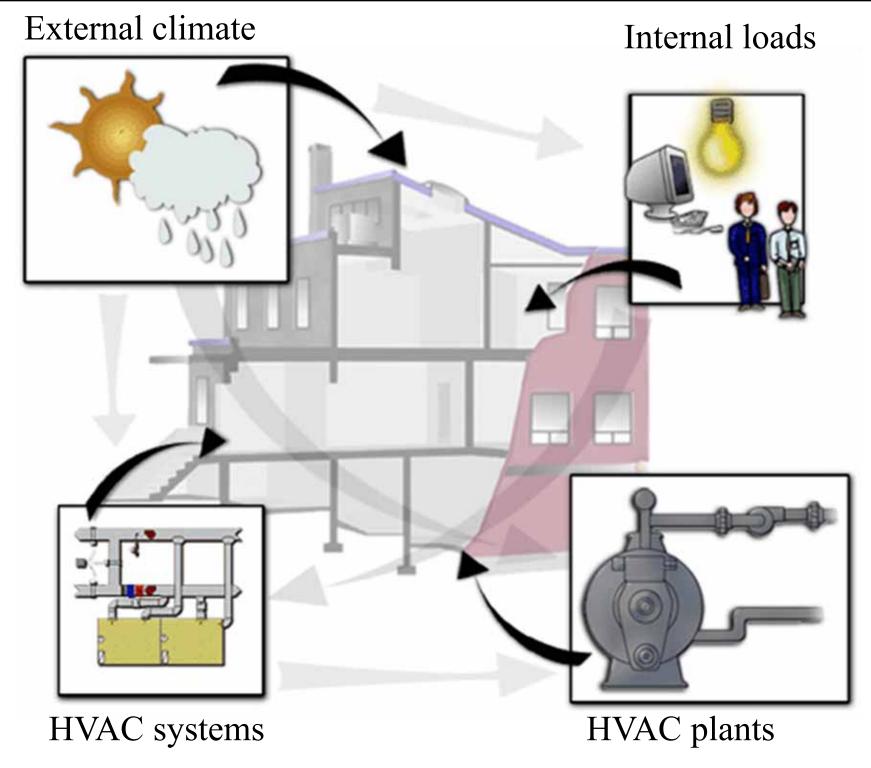

- Promote passive design and natural ventilation
 - e.g. bioclimatic buildings, passive cooling/heating
- Adopt energy efficient building services systems
 - Lighting, air-conditioning, electrical, lifts
- Needs to study thermal & energy performance
 - e.g. by computer simulation or energy audit
- Must also ensure efficient operation and management of the building
 - User education & awareness, good housekeeping

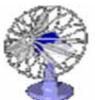

HVAC = heating, ventilation and air conditioning

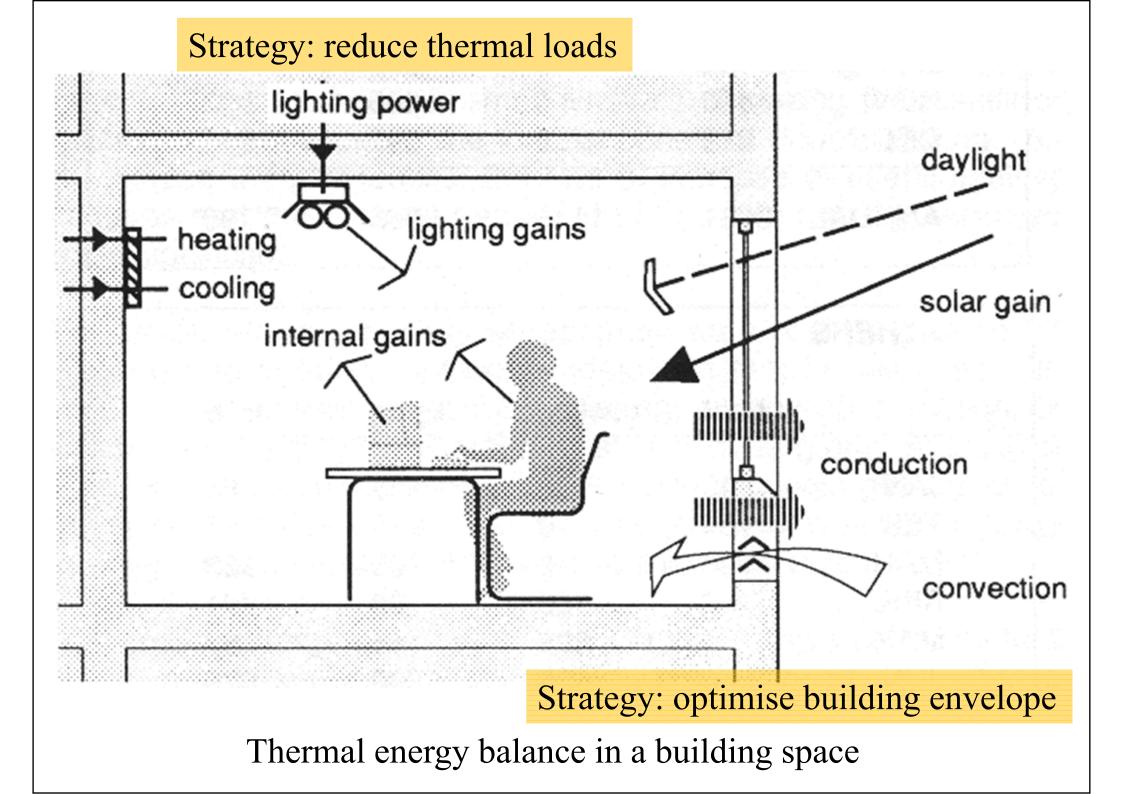

• Design strategies:

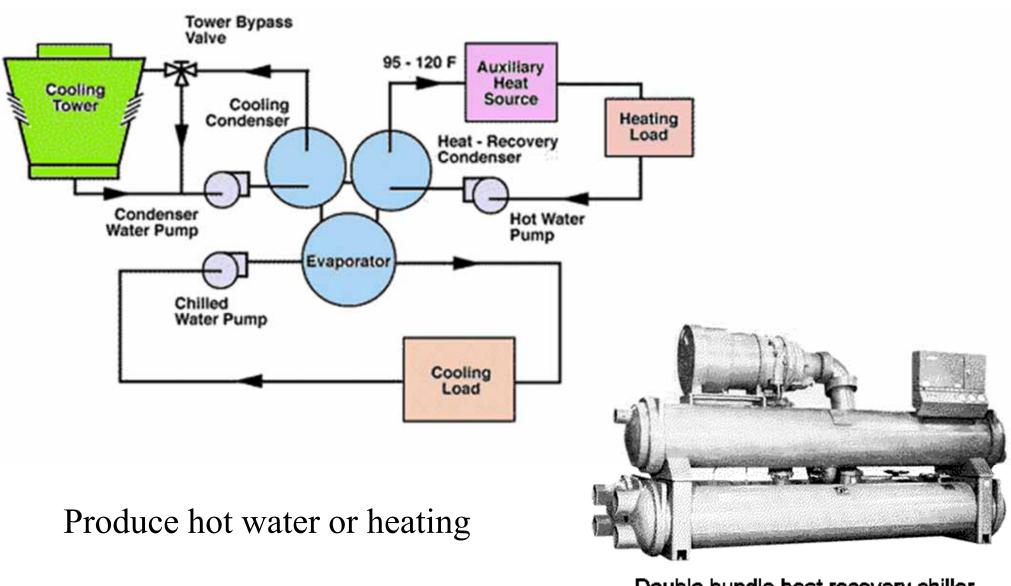

ন্য

- Minimise thermal loads & energy requirements
 - e.g. by reducing heat gains from equipment
- Optimise window design & fabric thermal storage
 - Integrate architectural & engineering design
- <u>Promote</u> efficiency in building services systems
 - Use of heat recovery & free cooling methods
 - Energy efficient lighting design & control
 - High-efficiency mechanical & electrical systems

<u>Adopt</u> total energy approach (e.g. district cooling, combined heat & power)

Strategy: use of heat recovery

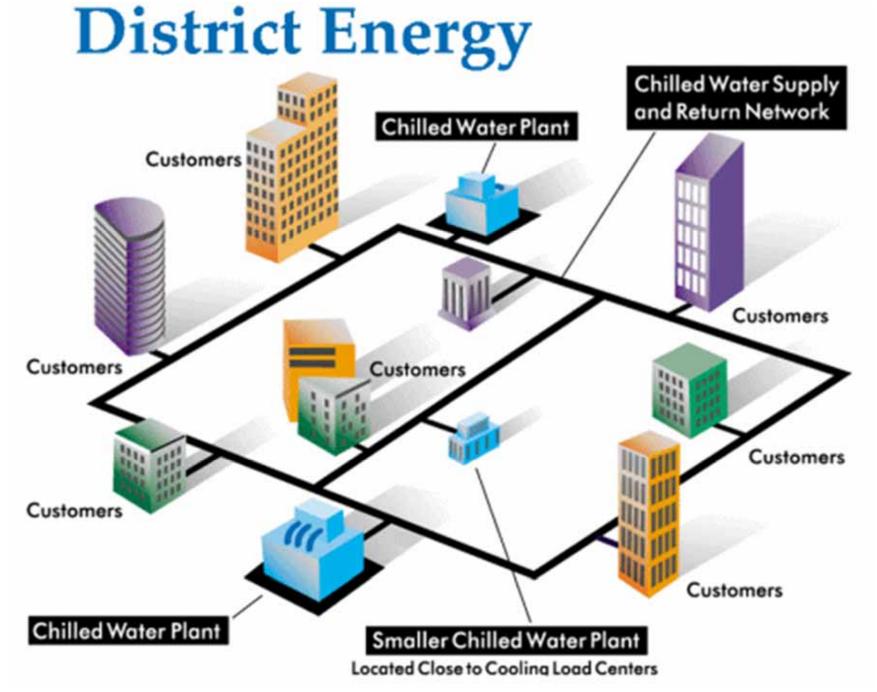

Double bundle heat recovery chiller

Waste heat recovery - double bundle heat recovery chiller

District cooling system (DCS)

Strategy: total energy approach

(Source: www.entergy-thermal.com/district_energy)

Renewable energy

- Energy that occurs <u>naturally</u> and <u>repeatedly</u> on earth and can be harnessed for human benefit, e.g. solar, wind and biomass
- Common applications
 - Solar hot water
 - Solar photovoltaic
 - Wind energy
 - Geothermal
 - Small hydros

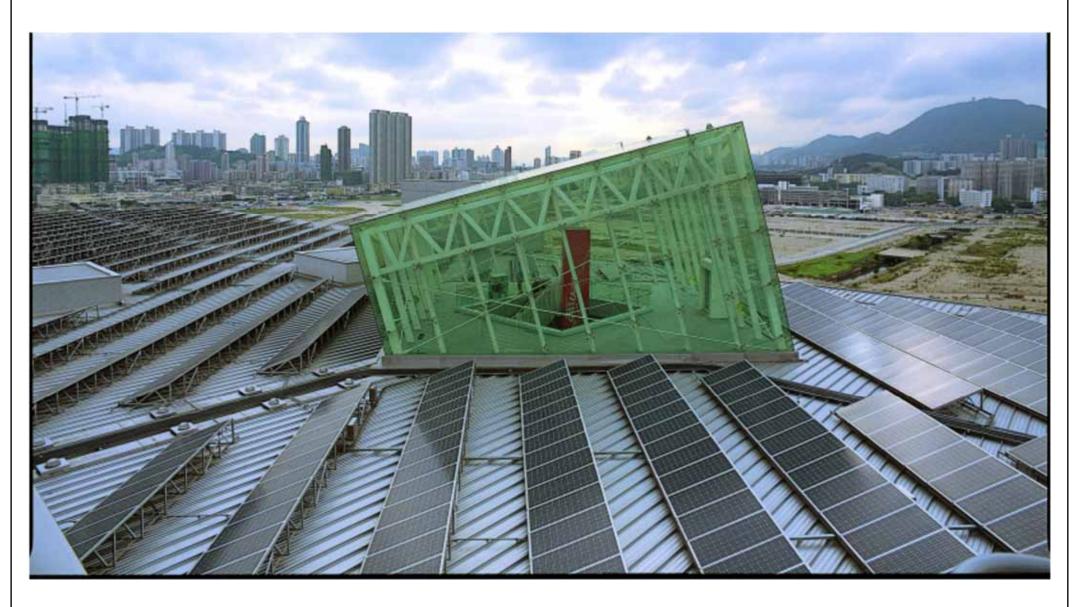

Solar heating for a swimming pool complex in Kwai Chung (313 sq.m solar collectors)

Solar hot water system at Sheung Shui Slaughter House (882 sq.m solar collectors)

Solar thermal systems in Hong Kong

A 350 kW solar photovoltaic (PV) installation installed on the roof of the EMSD Headquarters in Kowloon Bay (2,300 PV modules with a total area of 3,180 sq.m) [Source: EMSD]

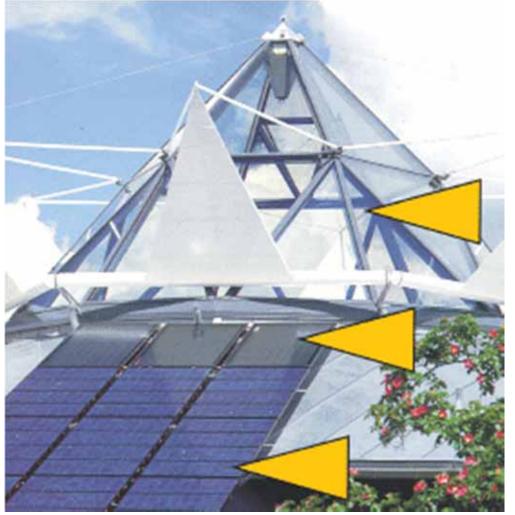

Solar PV systems in Hong Kong Science Park

Renewable energy

- Renewables for buildings
 - Solar energy
 - Passive (low energy architecture)
 - Active (solar thermal)
 - Photovoltaics
 - Other renewables
 - Wind (using buildings to harvest wind energy)
 - Geothermal (e.g. hot springs)
 - Small hydros (e.g. water wheels)
 - Hybrid systems (e.g. PV + wind + diesel)

O

Passive solar (e.g. skylight)

Active solar (solar hot water)

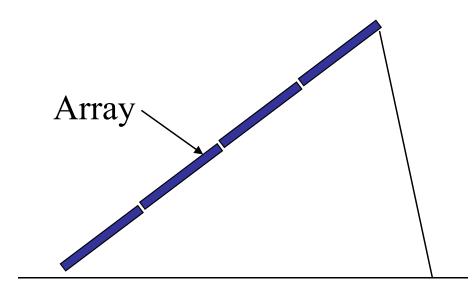

Photovoltaics

Integration of solar energy systems in buildings

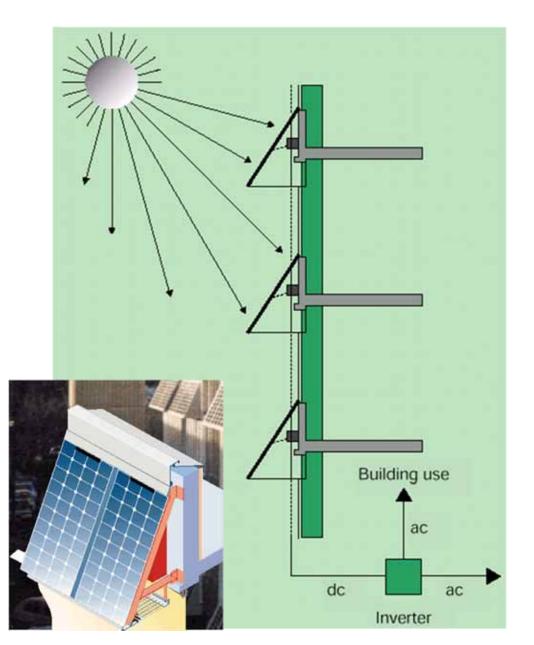

Evacuated-tube solar hot water system in a hotel in Lhsa, Tibet (photo taken by Dr Sam C M Hui)

Building materials

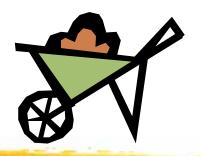

- Environmental impact of building materials
 - Through <u>consumption</u> of resources
 - Through <u>production</u> of resources (by-products, wastes, pollution, recyclables)

• Objectives

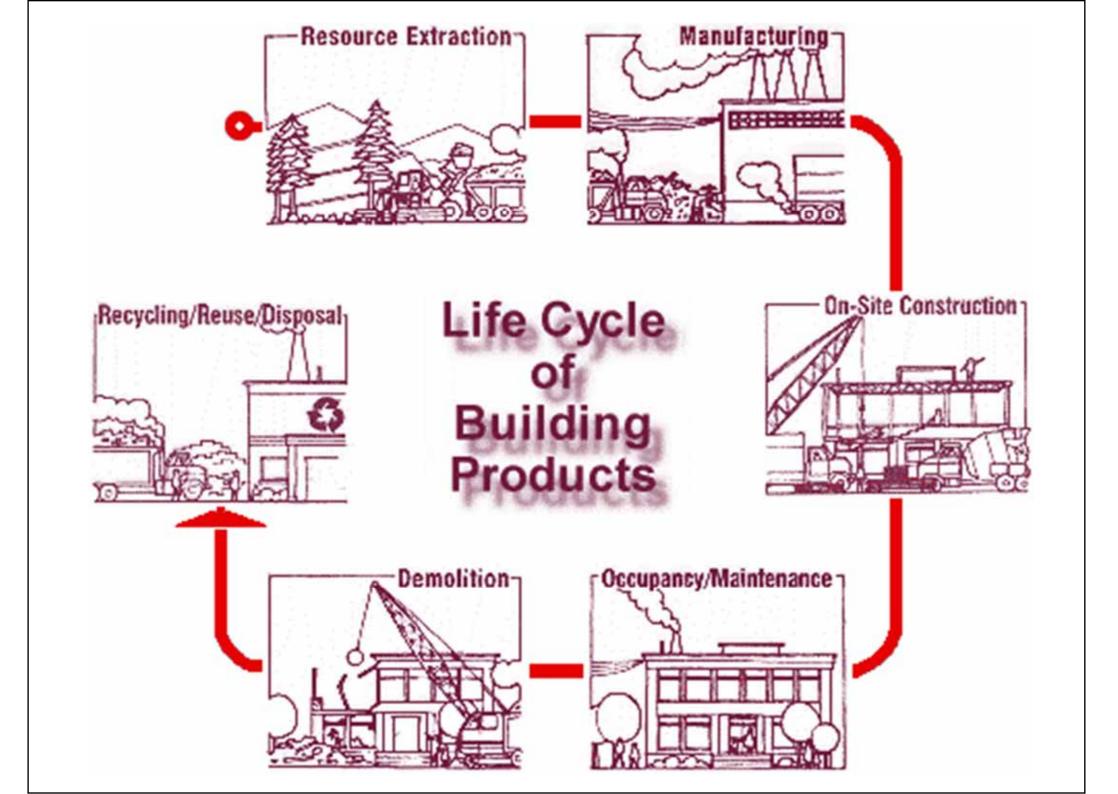

- Make informed environmental choices about building materials and systems
- Careful design & understanding about materials

Building materials

- What makes a product green?
 - Measured by their environmental impact
 - Life cycle of a sustainable material
 - Using local, durable materials
- Embodied energy*
 - 'Lifetime' energy requirement of a material
 - Energy input required to quarry, transport and manufacture the material, plus the energy used in the construction process

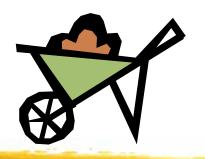

[* http://en.wikipedia.org/wiki/Embodied energy]

Estimated embodied energy of insulation materials

Material	Embodied energy (MJ/kg)	Mass per insulating unit (kg)	Embodied energy per insulating unit (MJ)
Cellulose	1.8	0.41	0.7
Fiberglass	28	0.17	5
Mineral wool	15	0.34	5
EPS	75	0.18	13
Polysio	70	0.22	15

Building materials

- Specify green materials & products
 - Made from environmentally attractive materials
 - Such as reclaimed, recycled or recyclable products
 - That reduce environmental impacts during construction, renovation, or demolition
 - That reduce environmental impacts of building operation
 - That contribute to a safe, healthy indoor environment
 - That are green because what isn't there (e.g. CFC)

Green Features				
Manufacturing Process (MP)	Building Operations (BO)	Waste Mgmt. (WM)		
Waste Reduction (WR)	Energy Efficiency (EE)	Biodegradable (B)		
Pollution Prevention (P2)	Water Treatment & Conservation (WTC)	Recyclable (R)		
Recycled (RC)	Nontoxic (NT)	Reusable (RU)		
Embodied Energy Reduction (EER)	Renewable Energy Source (RES)	Others (O)		
Natural Materials (NM)	Longer Life (LL)			

Building materials

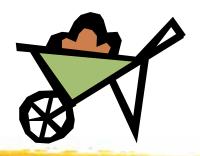

- Material conservation
 - Adapt existing buildings to new uses
 - Material conserving design & construction
 - Size buildings & systems properly

- Use environment-friendly materials & products
- Design for deconstruction ("close the loop")
- Life cycle assessment (LCA) is often used to evaluate the environmental impact of building materials and products

Building materials

• Waste management strategies

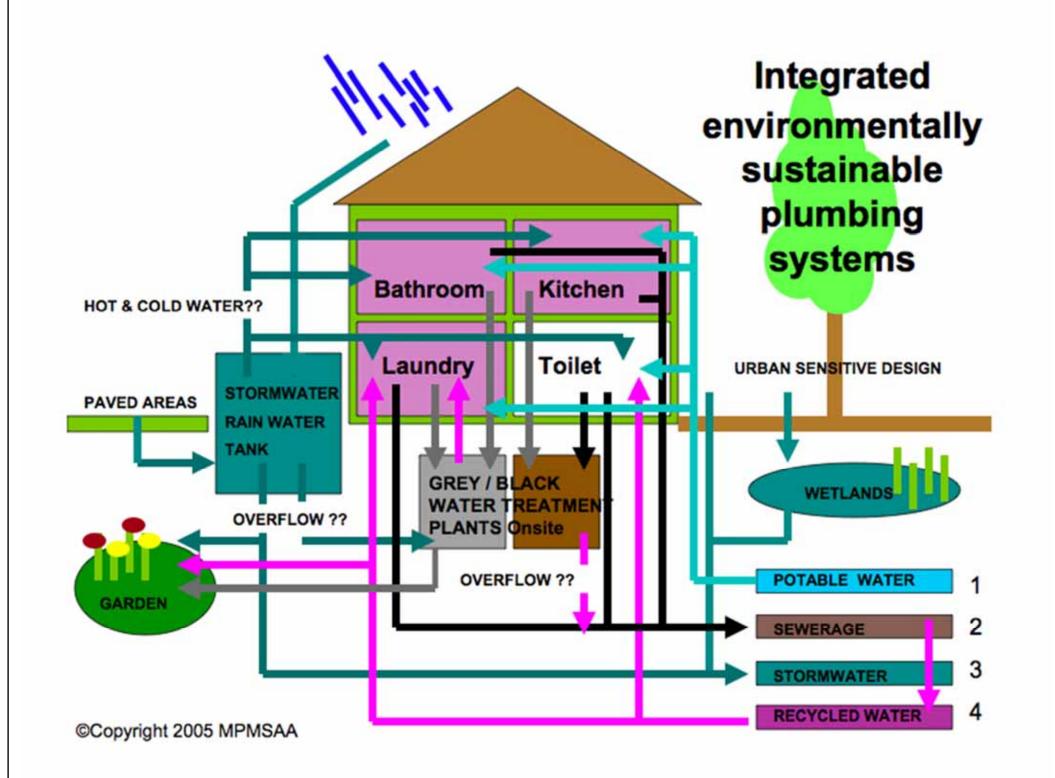

- Waste prevention & reduction
- Construction and demolition recycling
- Architectural reuse
- Design for material recovery
- Important factors
 - On-site collection & storage space
 - In HK, the space is very limited
 - Sorting & separation (paper, glass, plastic, metal)

Water issues

Stormwater or watershed protection

- Control rainwater runoff, flooding and erosion
 - Preservation of soils and drainage ways
 - Porous paving materials
 - Drainage of concentrated runoff
- Avoid pollution and soil disturbance
- Water efficiency and conservation
- Saving of water and money: water-use charge, sewage treatment costs, energy use, chemical use

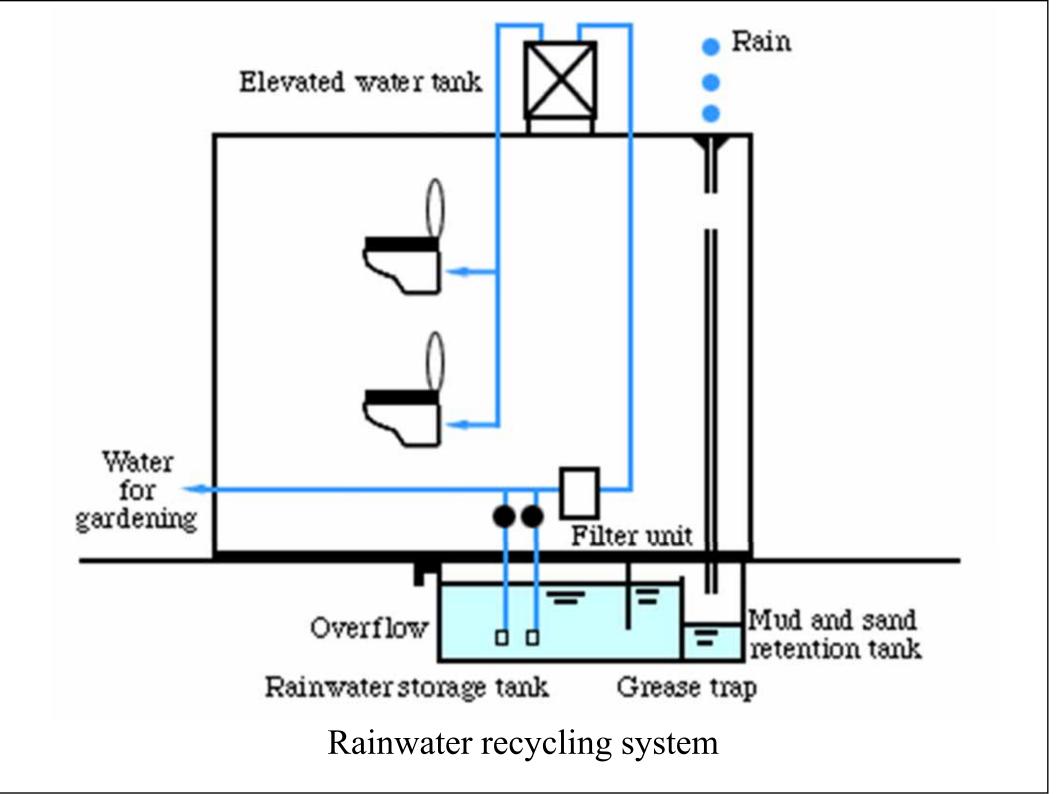

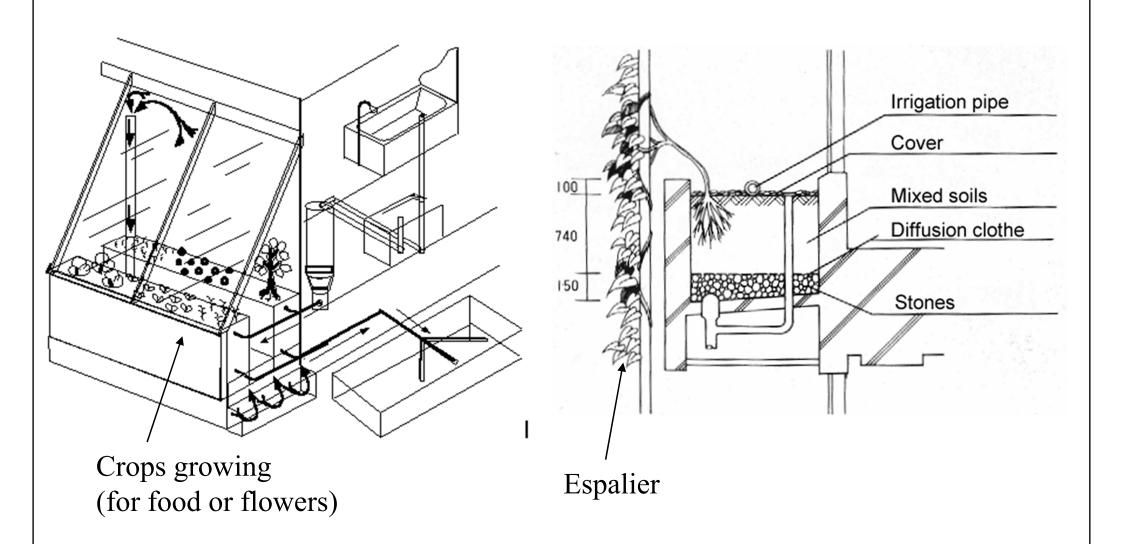

Water issues

- Design strategy for water efficiency
 - <u>Reduce</u> water consumption
 - Low-flush toilets & showerheads
 - Leak detection & prevention
 - Correct use of appliances (e.g. washing machine)
 - <u>Reuse</u> and <u>recycle</u> water onsite
 - Rainwater collection & recycling
 - Greywater recycling (e.g. for irrigation)
 - No-/Low-water composting toilet

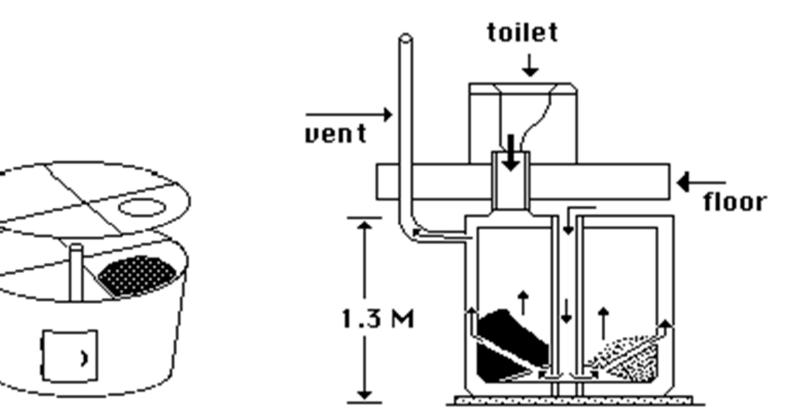

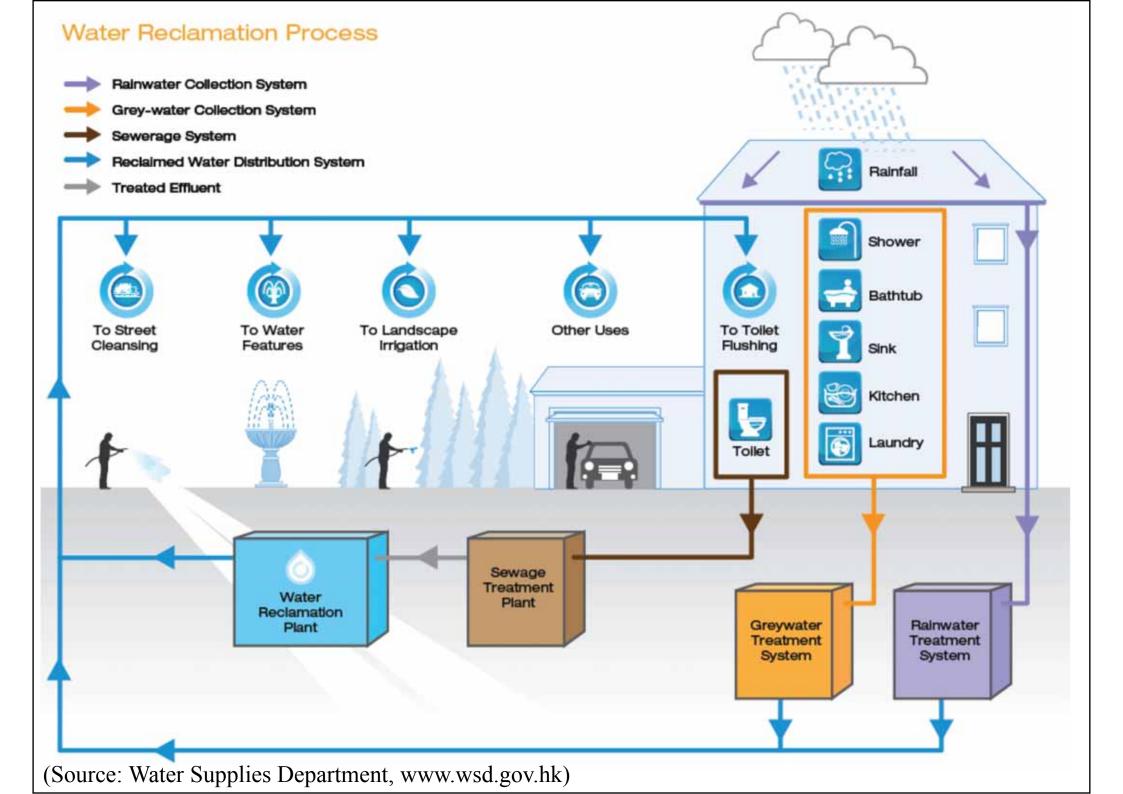

Using greywater for crops and landscape irrigation

Composting toilets

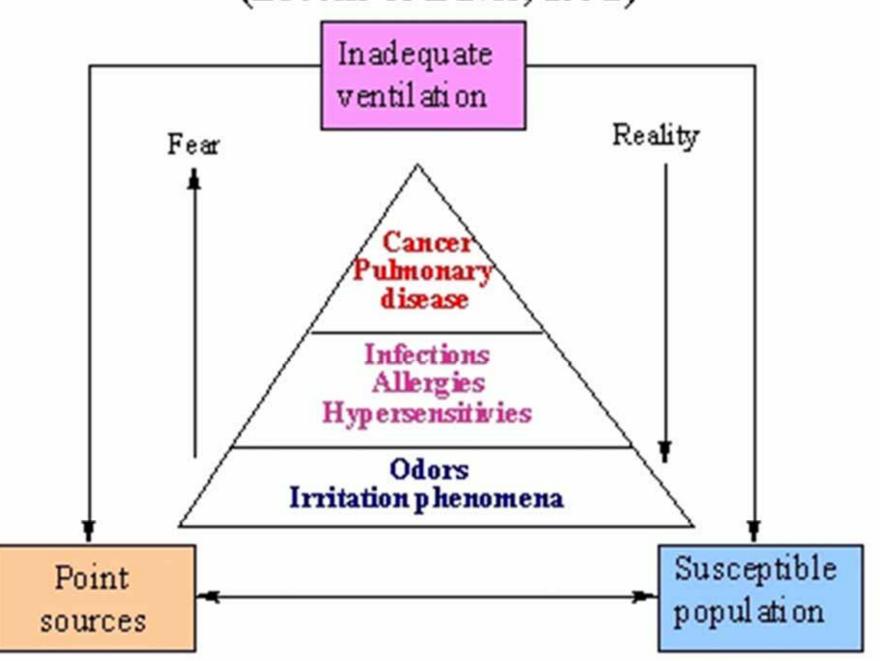

• Indoor environmental quality (IEQ)

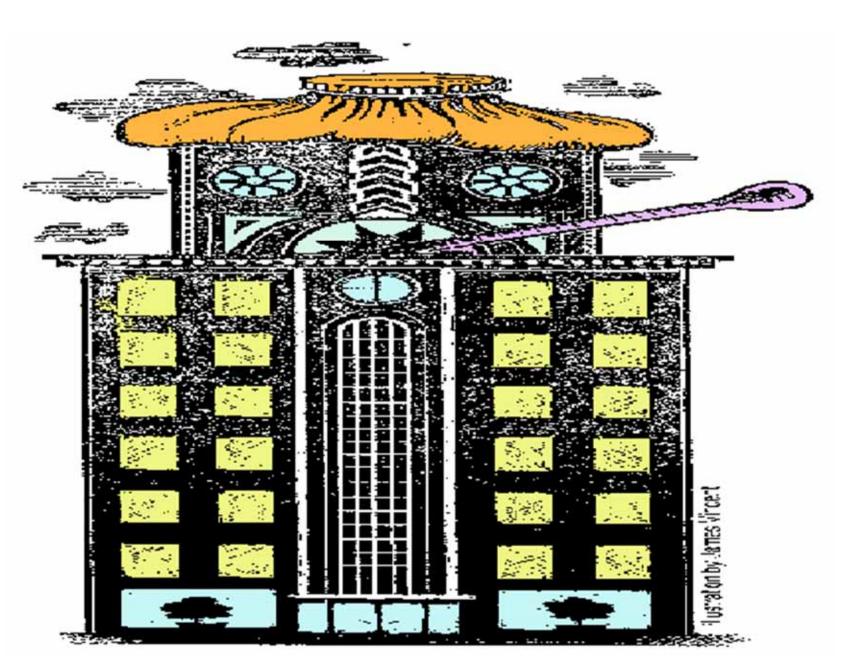

- Indoor air quality
 - Ensure health & well-being
- Visual quality
 - Provide daylight & comfortable conditions
- Acoustic quality
 - Noise control
- Controllability
 - Allow occupant control over thermal & visual

- Indoor air quality (IAQ)
 - People spend most of their time indoors
 - Pollutants may build up in an enclosed space
 - Effects on health and productivity
- Control methods
 - Assess materials to avoid health hazards
 - Such as volatile organic compounds (VOC)
 - Ensure good ventilation & building management

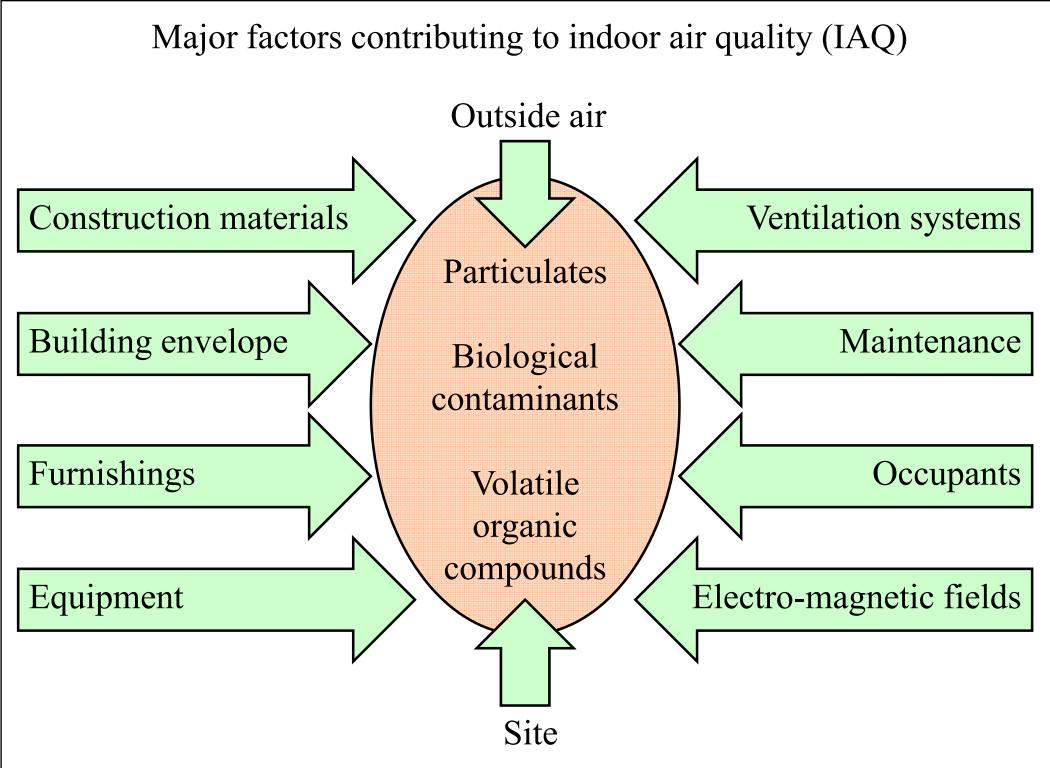

Understanding Indoor Air Quality Problems (Brooks & Davis, 1992)

- IAQ problems
 - Not simple, and is constantly changing interaction of complex factors including:
 - Source of pollutants or odours
 - Maintenance and operation of ventilating systems
 - Moisture and humidity
 - Occupant perceptions and susceptibilities (e.g. elderly)
 - Other psychological factors
 - May cause dissatisfaction and complaints, but cannot determine the reasons [Sick Building]

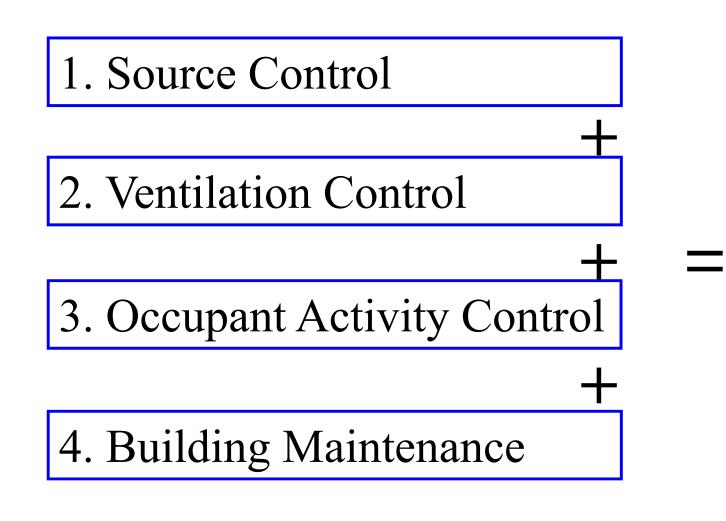

Avoid "sick building syndromes" by maintaining good indoor air quality

(Source: PTI, 1996. Sustainable Building Technical Manual)

Four principles of indoor air quality design

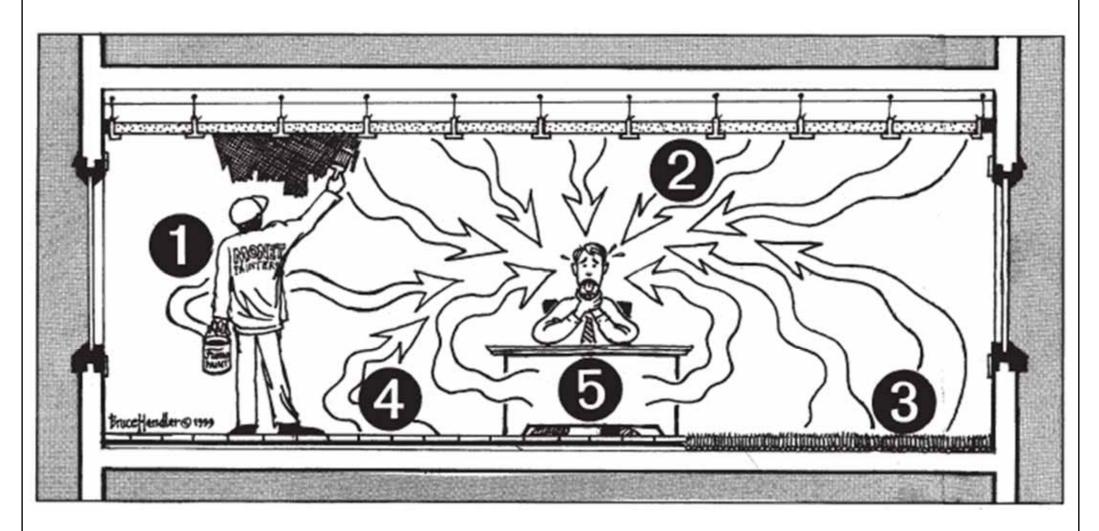

Total Indoor Air Quality

(Source: PTI, 1996. Sustainable Building Technical Manual)

• <u>Source control</u>

- Site
- Construction materials
- Equipment
- Building contents
- Human activity
- Light & noise
- Furnishings
- HVAC Systems

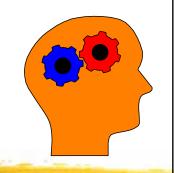

Sources of offgassing in building materials: 1) paints, 2) ceiling tiles, 3) carpeting, 4) VCT floor tiles 5) manufactured wood products

Ventilation control

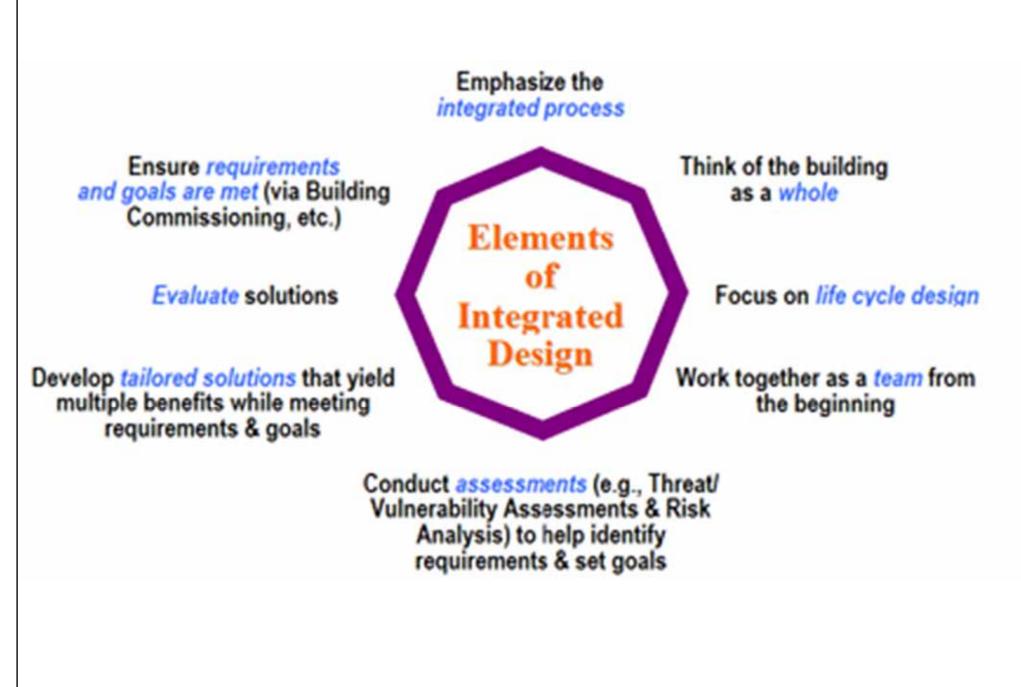

- Air intake location
- Air exhaust location
- Air filtration
- Fibrous insulation
- Ventilation rates
- Temperature, humidity
- Control systems, exhaust systems
- Building commissioning

Integrated building design

- WBDG The Whole Building Design Guide
 - www.wbdg.org
- Two components of whole building design:
 - Integrated design approach
 - Integrated team process
- A holistic design philosophy
 - Holism + Interconnectedness + Synergy
 - "The whole is greater than the sum of its parts"

(Source: www.wbdg.org)

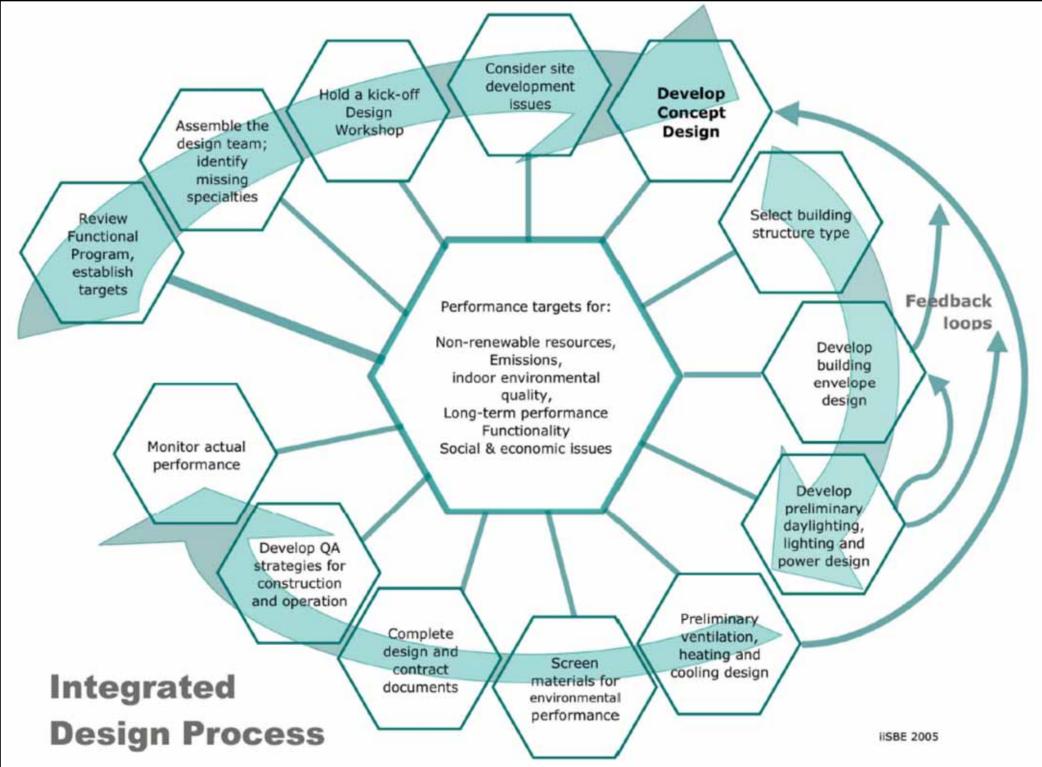

Integrated building design

- Typical integrated design process
 - Preparation
 - Design development
 - Contract documents
 - Construction phase
 - Commissioning
 - Post-occupancy evaluation

• Usually more efforts in preparation and predesign phases

(Source: International Initiative for a Sustainable Built Environment (iiSBE), www.iisbe.org)

Integrated building design

- Integrated, multidisciplinary project team
 - Owner's representative
 - Architect
 - Building Services Engineer
 - Civil/Structural Engineer
 - Construction Manager
 - Landscape Architect
 - Specialized Consultants

Video Presentation

- Pennsylvania's First Green Building [29 min.]
 - Department of Environmental Protection Southcentral Regional Office Building
 - Location: Pennsylvania, USA; completion: 1999

How many green team members?

Pennsylvania Department of Environmental Protection Harrisburg, Pennsylvania

Owner:	New Morgan Municipal Authority	
Project Team:	Architect:	Kostecky Group
	Engineer:	Deepal Wickramasinghe & N.K Gunawardana
	Contractor: Consultant:	
Building Statistics:		
Completion Date:	May, 1998	
Cost:	\$5.7 M	
Size:	73,000 gross square feet	
Footprint	26,770 square feet	
Construction Type:	Three story steel frame	
Use Group:	Business (State Government Office Building)	
Lot Size:	13.4 acres	
Occupancy:	240 Employees	

LEED[™] 1.0 Certification: BRONZE

Notes from the Project Team: *LEEDTM is an invaluable tool for Building Green in Pennsylvania projects which require an integrative design and measuring tool for High Performance Green Buildings.*

- Sustainable Sites
 - Site Selection: Brownfield (once a quarry then landfill) and within the Harrisburg Area Economic Development Corridor
 - Resource Protection: Leachate & Methane collection for remediation, indigenous plants, & Xeroscaping regenerate natural landscape
- Water Efficiency
 - Water: Complies with Energy Policy Act Of 1992, uses water saving fixtures
 - · Storm/Wastewater: Xeriscaping techniques help manage stormwater
- Energy and Atmosphere
 - Energy: Exceeds ASHRAE/IES Standard 90.1-1989 by 20%
 - HVAC: Raised floor air plenum with individual control of air flow/temperature
 - Controls/Monitoring: Energy and air monitoring systems measure temperature, relative humidity, and CO₂
 - · Power Source: Gas-Fired absorption chiller uses water as refrigerant
 - Lighting: Split task indirect ambient with high reflectance celling tiles, T-8 lamps and light shelves enhance day lighting
- Materials and Resources
 - · Structure: 94% postindustrial Nucor recycled steel frame
 - · Recycled Content: 25% of materials have substantial recycled content.
- Indoor Environmental Quality
 - · Low Emitting Materials: Concrete floor with Low-VOC sealant
 - Furniture: Conference room chairs' seat fabric made of wool & plant fiber--toxic free biodegradable. Panel fabric made of100% postconsumer recycled plastic PET.
